Executive summary
THIS REPORT ASSESSES the impact of five of Guilford Technical Community College’s (GTCC) programs on the Guilford County economy, the return on investment to the program’s students, and the benefits generated for North Carolina taxpayers. Following are some of the key findings of this analysis.

**Aviation Electronics (Avionics) Technology**

In FY 2019-20, GTCC enrolled 64 students in its Avionics Technology program. Students who complete this program are expected to enter occupations such as avionics technicians and electrical & electronics installers & repairers, transportation equipment. In Guilford County, the average number of annual job openings in these types of occupations in 2020 was 17, and over the next 10 years the average number of jobs is expected to grow 1.8%. Comparing annual job openings to GTCC completers for the Avionics Technology program, there is a gap of seven job openings. GTCC’s Avionics Technology program alumni generated an estimated $384.5 thousand in added income to the Guilford County economy in FY 2019-20. The undiscounted lifetime earnings increase per student is $684.2 thousand. For every dollar a student invests in their education in GTCC’s Avionics Technology program, they will receive $5.00 back over the course of their working lives. The corresponding internal rate of return is 21.3% for students in the Avionics Technology program. Finally, students aren’t the only ones who receive benefits from completing the Avionics Technology program at GTCC. North Carolina taxpayers will also receive benefits from GTCC’s Avionics Technology program students in the form of added tax revenues and government savings. In total, throughout the FY 2019-20 students’ working lifetime, North Carolina taxpayers will receive $1.1 million in present value benefits.

**Supply Chain Management**

In FY 2019-20, GTCC enrolled 79 students in its Supply Chain Management program. Students who complete this program are expected to enter occupations such as industrial production managers; purchasing managers; and transportation, storage, & distribution managers. In Guilford County, the average number of annual job openings in these types of occupations in 2020 was 46, and over the next 10 years the average number of jobs is expected to grow 0.5%. Comparing annual job openings to GTCC completers for the Supply Chain Management program, there is a gap of 33 job openings.

---

1 For the purposes of this analysis, only GTCC completers were considered when comparing to annual openings.
openings. GTCC’s Supply Chain Management program alumni generated an estimated $92 thousand in added income to the Guilford County economy in FY 2019-20. The undiscounted lifetime earnings increase per student is $809.3 thousand. For every dollar a student invests in their education in GTCC’s Supply Chain Management program, they will receive $8.60 back over the course of their working lives. The corresponding internal rate of return is 46.8% for students in the Supply Chain Management program. Finally, students aren’t the only ones who receive benefits from completing the Supply Chain Management program at GTCC. North Carolina taxpayers will also receive benefits from GTCC’s Supply Chain Management program students in the form of added tax revenues and government savings. In total, throughout the FY 2019-20 students’ working lifetime, North Carolina taxpayers will receive $1.7 million in present value benefits.

Health Information Technology

In FY 2019-20, GTCC enrolled 24 students in its Health Information Technology program. Students who complete this program are expected to enter occupations such as medical dosimetrists, medical records specialists, health technologists & technicians, all other; medical secretaries & administrative assistants; and data entry keyers. In Guilford County, the average number of annual job openings in these types of occupations in 2020 was 90, and over the next 10 years the average number of jobs is expected to grow 0.5%. Comparing annual job openings to GTCC completers for the Health Information Technology program, there is a gap of 86 job openings. GTCC’s Health Information Technology program alumni generated an estimated $3.1 thousand in added income to the Guilford County economy in FY 2019-20. The undiscounted lifetime earnings increase per student is $290.5 thousand. For every dollar a student invests in their education in GTCC’s Health Information Technology program, they will receive $2.50 back over the course of their working lives. The corresponding internal rate of return is 13.4% for students in the Health Information Technology program. Finally, students aren’t the only ones who receive benefits from completing the Health Information Technology program at GTCC. North Carolina taxpayers will also receive benefits from GTCC’s Health Information Technology program students in the form of added tax revenues and government savings. In total, throughout the FY 2019-20 students’ working lifetime, North Carolina taxpayers will receive $106.5 thousand in present value benefits.

Carpentry (Residential and Commercial)

In FY 2019-20, GTCC enrolled 26 students in its Carpentry program. Students who complete this program are expected to enter occupations such as carpenters; carpenter helpers; and cabinetmakers & bench carpenters. In Guilford County, the average number of annual job openings in these types of occupations in 2020 was 48, and over the next 10 years the average number of jobs is expected to grow 0.1%. Comparing annual job openings to GTCC completers for the Carpentry program, there is a gap of 45
job openings. GTCC’s Carpentry program alumni generated an estimated $322.7 thousand in added income to the Guilford County economy in FY 2019-20. The undiscounted lifetime earnings increase per student is $252.8 thousand. For every dollar a student invests in their education in GTCC’s Carpentry program, they will receive $3.90 back over the course of their working lives. The corresponding internal rate of return is 35.3% for students in the Carpentry program. Finally, students aren’t the only ones who receive benefits from completing the Carpentry program at GTCC. North Carolina taxpayers will also receive benefits from GTCC’s Carpentry program students in the form of added tax revenues and government savings. In total, throughout the FY 2019-20 students’ working lifetime, North Carolina taxpayers will receive $129.9 thousand in present value benefits.

**Diesel and Heavy Equipment Technology**

In FY 2019-20, GTCC enrolled 44 students in its Diesel and Heavy Equipment Technology program. Students who complete this program are expected to enter occupations such as automotive service technicians & mechanics and bus & truck mechanics & diesel engine specialists. In Guilford County, the average number of annual job openings in these types of occupations in 2020 was 69, and over the next 10 years the average number of jobs is expected to grow 0.4%. Comparing annual job openings to GTCC completers for the Diesel and Heavy Equipment Technology program, there is a gap of 59 job openings. GTCC’s Diesel and Heavy Equipment Technology program alumni generated an estimated $62.6 thousand in added income to the Guilford County economy in FY 2019-20. The undiscounted lifetime earnings increase per student is $348.4 thousand. For every dollar a student invests in their education in GTCC’s Diesel and Heavy Equipment Technology program, they will receive $4.10 back over the course of their working lives. The corresponding internal rate of return is 16.6% for students in the Diesel and Heavy Equipment Technology program. Finally, students aren’t the only ones who receive benefits from completing the Diesel and Heavy Equipment Technology program at GTCC. North Carolina taxpayers will also receive benefits from GTCC’s Diesel and Heavy Equipment Technology program students in the form of added tax revenues and government savings. In total, throughout the FY 2019-20 students’ working lifetime, North Carolina taxpayers will receive $522.6 thousand in present value benefits.
Chapter 1: Introduction
GUILFORD Technical Community College’s (GTCC) region, for the purpose of this report, is Guilford County. While GTCC offers a variety of programs, this study is concerned with considering the economic impact and return on investment derived from the students of five of its programs. These programs include:

- Aviation Electronics (Avionics) Technology
- Supply Chain Management
- Health Information Technology
- Carpentry (Residential and Commercial)
- Diesel and Heavy Equipment Technology

The first component of this study analyzes the career outlook for each program. Each program maps to a number of occupations, which we use to measure the number of annual job openings available to completers of each program. Finally, we provide the median hourly wage and top companies hiring in Guilford County.

The second component of the study measures the economic impact from the alumni of each program. While the programs each affect the county in a variety of ways, many of them difficult to quantify, this study is concerned with considering the economic benefits of their alumni. The programs are designed to help students achieve their individual potential and develop the knowledge, skills, and abilities they need to have fulfilling and prosperous careers. However, the value of GTCC consists of more than simply influencing the lives of students. The college’s program offerings supply employers with workers to make their businesses more productive. To derive results, we rely on a specialized Multi-Regional Social
Accounting Matrix (MR-SAM) model to calculate the added income created in the Guilford County economy as a result of increased consumer spending and the added knowledge, skills, and abilities of students.

The third component of the study measures the benefits generated by students of the programs. We perform an investment analysis to determine how the money spent by the programs’ students on their education performs as an investment over time. The students’ investment in this case consists of their out-of-pocket expenses and their opportunity cost of attending the college as opposed to working. In return for these investments, students receive a lifetime of higher earnings.

The fourth component of the study measures the benefits generated by program students for North Carolina taxpayers. As FY 2019-20 students earn more because of the education they received at GTCC, the tax base in North Carolina will also increase. In addition, savings will be generated to the public sector from reduced demand for government-funded social services in North Carolina.

The study uses a wide array of data that are based on several sources, including the programs’ FY 2019-20 academic and student financial data from GTCC; industry and employment data from the Bureau of Labor Statistics and Census Bureau; outputs of Emsi Burning Glass’s impact model and MR-SAM model; and a variety of published materials relating education to social behavior.

Important note
When reviewing the impacts estimated in this study, it is important to note that the study reports impacts in the form of added income rather than sales. Sales includes all of the intermediary costs associated with producing goods and services, as well as money that leaks out of the county as it is spent at out-of-county businesses. Income, on the other hand, is a net measure that excludes these intermediary costs and leakages, and is synonymous with gross regional product (GRP) and value added. For this reason, it is a more meaningful measure of new economic activity than sales.
GTCC serves a region referred to as Guilford County in North Carolina. Since the college was first established, it has been serving Guilford County by enhancing the workforce, providing local residents with easy access to higher education opportunities and preparing students for highly-skilled, technical professions. Table 1.1 summarizes the breakdown of the county economy by major industrial sector ordered by total income, with details on labor and non-labor income. Labor income refers to wages, salaries, and proprietors’ income. Non-labor income refers to profits, rents, and other forms of investment income. Together, labor and non-labor income comprise the county’s total income, which can also be considered as the county’s gross regional product (GRP). As shown in Table 1.1, the total income, or GRP, of Guilford County is approximately $34.5 billion, equal to the sum of labor income ($21.2 billion) and non-labor income ($13.4 billion).

* Data reflect the most recent year for which data are available. Emsi Burning Glass data are updated quarterly.
** Numbers may not add due to rounding.
Source: Emsi Burning Glass industry data.
Figure 1.1 provides the breakdown of jobs by industry in Guilford County. The Health Care & Social Assistance sector is the largest employer, supporting 41,352 jobs or 11.0% of total employment in the county. The second largest employer is the Retail Trade sector, supporting 35,071 jobs or 9.3% of the county’s total employment. Altogether, the county supports 377,040 jobs.

* Data reflect the most recent year for which data are available. Emsi Burning Glass data are updated quarterly. Source: Emsi Burning Glass employment data.

2 Job numbers reflect Emsi Burning Glass’s complete employment data, which includes the following four job classes: 1) employees who are counted in the Bureau of Labor Statistics’ Quarterly Census of Employment and Wages (QCEW), 2) employees who are not covered by the federal or state unemployment insurance (UI) system and are thus excluded from QCEW, 3) self-employed workers, and 4) extended proprietors.
The Avionics Technology program can lead students into a number of occupations, which may include avionics technicians and electrical & electronics installers & repairers, transportation equipment. The two mapped occupations supported 235 jobs in the Guilford County economy in 2020. Over the next 10 years, these jobs are expected to grow 1.8% (Figure 1.2). In 2020, there were 17 job openings\(^3\) within the mapped occupations. The average median annual wage for these openings was $49,340.

The 17 job openings are in part being filled by the 10 Avionics Technology program GTCC completers. Subtracting this supply of human capital from the 17 annual openings, we arrive at seven job openings, or a gap of seven.\(^4\) This means there is not enough supply of trained workers in this area to meet the need of county employers. In 2020, county employers posted 14 unique job postings at the associate degree level or below for these occupations in Guilford County.\(^5\)

---

3 The job openings reported in this analysis are specific to students entering the workforce with an associate degree and below.
4 For the purposes of this analysis, only GTCC completers were considered when comparing to annual openings.
5 Job openings and job postings come from different data sources and can therefore differ from each other. They both provide insights into local employer demand. Job openings are from government data sources and, while lagged, can be more stable. Job postings reflect real-time employer demand but can have more fluctuations.
The top companies posting are Signature Flight Support Corporation; Aeroteams Manage Aviation Solution; and Haeco Americas (Table 1.2).

### Supply Chain Management Program

The Supply Chain Management program can lead students into a number of occupations, which may include industrial production managers; purchasing managers; and transportation, storage, & distribution managers. The five mapped occupations supported 1,498 jobs in the Guilford County economy in 2020. Over the next 10 years, these jobs are expected to grow 0.5% (Figure 1.3). In 2020, there were 46 job openings within the mapped occupations. The average median annual wage for these openings was $78,123.

### Figure 1.3: Projected Job Growth in Guilford County of Supply Chain Management Program Mapped Occupations

Source: Emsi Burning Glass.

6 For a complete list of mapped occupations see Appendix 1.
The 46 job openings are in part being filled by the 13 Supply Chain Management program GTCC completers. Subtracting this supply of human capital from the 46 annual openings, we arrive at 33 job openings, or a gap of 33. This means there is not enough supply of trained workers in this area to meet the need of county employers. In 2020, county employers posted 61 unique job postings at the associate degree level or below for these occupations in Guilford County. The top companies posting are Xpo Logistics, Inc.; Volvo Group; and Army National Guard (Table 1.3).

**Health Information Technology program**

The Health Information Technology program can lead students into a number of occupations, which may include medical dosimetrists, medical records specialists, health technologists & technicians, all other; medical secretaries & administrative assistants; and data entry keyers. The three mapped occupations supported 1,886 jobs in the Guilford County economy in 2020. Over the next 10 years, these jobs are expected to grow 0.5% (Figure 1.4). In 2020, there were 90 job openings within the mapped occupations. The average median annual wage for these openings was $36,165.

The 90 annual job openings are in part being filled by the four Health Information Technology program GTCC completers. Subtracting this supply of human capital from the 90 annual openings, we arrive at 86 job openings, or a gap of 86. This means there is not enough supply of trained workers in this area to meet the need of county employers. In 2020, county employers posted 175 unique job postings at the associate degree level or below for these occupations in Guilford County. The top companies posting are Cone Health; Hirerocket, Inc.; and Atrium Health (Table 1.4).
Chapter 1: Introduction

The Carpentry program can lead students into a number of occupations, which may include carpenters; carpenter helpers; and cabinetmakers & bench carpenters. The seven mapped occupations supported 2,142 jobs in the Guilford County economy in 2020. Over the next 10 years, these jobs are expected to grow 0.1% (Figure 1.5). In 2020, there were 48 job openings within the mapped occupations. The average median annual wage for these openings was $33,137.

The 48 annual job openings are in part being filled by the three Carpentry program GTCC completers. Subtracting this supply of human capital from the 48 annual openings, we arrive at 45 job openings, or a gap of 45. This means there is not enough supply of trained workers in this area to meet the need of county

**Diesel and Heavy Equipment Technology program**

The Diesel and Heavy Equipment Technology program can lead students into a number of occupations, which may include automotive service technicians & mechanics and bus & truck mechanics & diesel engine specialists. The two mapped occupations supported 2,030 jobs in the Guilford County economy in 2020. Over the next 10 years, these jobs are expected to grow 0.4% (Figure 1.6). In
2020, there were 69 job openings within the mapped occupations. The average median annual wage for these openings was $46,015.

The 69 annual job openings are in part being filled by the 10 Diesel and Heavy Equipment Technology program GTCC completers. Subtracting this supply of human capital from the 69 annual openings, we arrive at 59 job openings, or a gap of 59. This means there is not enough supply of trained workers in this area to meet the need of county employers. In 2020, county employers posted 201 unique job postings at the associate degree level or below for these occupations in Guilford County. The top companies posting are Guilford County Schools; Carmax, Inc.; and Cummins Inc. (Table 1.6).

CHAPTER 2:

Economic value of individual programs
Chapter 2: Economic value of individual programs

The Aviation Electronics (Avionics) Technology program\(^8\) was established in 2011. In FY 2019-20, GTCC enrolled 64 students in the program. Of these students, one graduated with a certificate and nine graduated with an associate degree in FY 2019-20.

CAREER OUTLOOK

The Avionics Technology program can lead students into a number of occupations, which may include avionics technicians and electrical & electronics installers & repairers, transportation equipment.

Using the county number of annual openings for these occupations (17) and subtracting the FY 2019-20 GTCC completers that may fill these openings (10), we arrive at a gap of seven job openings.\(^9\) There are 14 unique job postings at the associate degree or below for these occupations in Guilford County. The top three posting companies are: Signature Flight Support Corporation; Aeroteams Manage Aviation Solution; and Haeco Americas.

ALUMNI IMPACT

Former students of GTCC's Avionics Technology program added $384.5 thousand in income to the Guilford County economy in FY 2019-20. This figure represents the increased wages collected by former students active today in the county workforce as a direct result of their education, the increased output of businesses that employ these students, and the multiplier effects that occur.

\(^8\) The Avionics Technology program is defined by the following Classification of Instructional Program (CIP) code: Avionics Maintenance Technology/Technician (47.0609).

\(^9\) For the purposes of this analysis, only GTCC completers were considered when comparing to annual openings.

**CAREER OUTLOOK**

The Avionics Technology program can lead students into a number of occupations, which may include avionics technicians and electrical & electronics installers & repairers, transportation equipment.

Using the county number of annual openings for these occupations (17) and subtracting the FY 2019-20 GTCC completers that may fill these openings (10), we arrive at a gap of seven job openings.\(^9\) There are 14 unique job postings at the associate degree or below for these occupations in Guilford County. The top three posting companies are: Signature Flight Support Corporation; Aeroteams Manage Aviation Solution; and Haeco Americas.

**ALUMNI IMPACT**

Former students of GTCC’s Avionics Technology program added $384.5 thousand in income to the Guilford County economy in FY 2019-20. This figure represents the increased wages collected by former students active today in the county workforce as a direct result of their education, the increased output of businesses that employ these students, and the multiplier effects that occur.

**ALUMNI LIFETIME EARNINGS INCREASE AND IMPACT**

- **Lifetime earnings increase per completer**: $684.2 thousand
- **Total alumni impact in FY 2019-20**: $384.5 thousand
STUDENT RETURN ON INVESTMENT

To earn a degree or certificate in the program, students experience costs in the form of tuition and fees, books and supplies, and the opportunity cost of attending school instead of working. In return for this investment, students can earn higher wages. For every dollar students invest in their education in the program, they will receive $5.00 back over the course of their working lives. This investment can also be seen in terms of a rate of return of 21.3%. This is an impressive return, especially when compared to the U.S. stock market 30-year average return of 10.6%.

LIFETIME EARNINGS OF A PROGRAM COMPLETER COMPARSED TO A HIGH SCHOOL GRADUATE

![Graph showing lifetime earnings comparison](image)

Source: Emsi Burning Glass impact model.

TAXPAYER BENEFITS

Taxpayers will receive an estimated present value of $1 million in added tax revenue stemming from the students' higher lifetime earnings and the increased output of businesses. Savings to the public sector add another estimated $47.8 thousand in benefits due to a reduced demand for government-funded social services in North Carolina. Throughout the students’ working lives, North Carolina taxpayers will receive a total of $1.1 million in benefits.

Throughout the students’ working lives, North Carolina taxpayers gain in added tax revenue and public sector savings $1.1 million
The Supply Chain Management program was recently established in 2017. In FY 2019-20, GTCC enrolled 79 students in the program. Of these students, four graduated with a certificate and nine graduated with an associate degree in FY 2019-20.

**CAREER OUTLOOK**

The Supply Chain Management program can lead students into a number of occupations, which may include industrial production managers; purchasing managers; and transportation, storage, & distribution managers.

Using the county number of annual openings for these occupations (46) and subtracting the FY 2019-20 GTCC completers that may fill these openings (13), we arrive at a gap of 33 job openings. There are 61 unique job postings at the associate degree or below for these occupations in Guilford County. The top three posting companies are: Xpo Logistics, Inc.; Volvo Group; and Army National Guard.

**ALUMNI IMPACT**

Former students of GTCC’s Supply Chain Management program added $92 thousand in income to the Guilford County economy in FY 2019-20. This figure represents the increased wages collected by former students active today in the county workforce as a direct result of their education, the increased output of businesses that employ these students, and the multiplier effects that occur.

---

10 The Supply Chain Management program is defined by the following CIP code: Logistics, Materials, & Supply Chain Management (52.0203).

11 For the purposes of this analysis, only GTCC completers were considered when comparing to annual openings.
STUDENT RETURN ON INVESTMENT

To earn a degree or certificate in the program, students experience costs in the form of tuition and fees, books and supplies, and the opportunity cost of attending school instead of working. In return for this investment, students can earn higher wages. For every dollar students invest in their education in the program, they will receive $8.60 back over the course of their working lives. This investment can also be seen in terms of a rate of return of 46.8%. This is an impressive return, especially when compared to the U.S. stock market 30-year average return of 10.6%.

TAXPAVER BENEFITS

Taxpayers will receive an estimated present value of $1.6 million in added tax revenue stemming from the students’ higher lifetime earnings and the increased output of businesses. Savings to the public sector add another estimated $44 thousand in benefits due to a reduced demand for government-funded social services in North Carolina. Throughout the students’ working lives, North Carolina taxpayers will receive a total of $1.7 million in benefits.
The Health Information Technology program was recently established in 2017. In FY 2019-20, GTCC enrolled 24 students in the program. Of these students, four graduated with an associate degree in FY 2019-20.

CAREER OUTLOOK

The Health Information Technology program can lead students into a number of occupations, which may include medical dosimetrists, medical records specialists, & health technologists & technicians, all other; medical secretaries & administrative assistants; and data entry keyers.

Using the county number of annual openings for these occupations (90) and subtracting the FY 2019-20 GTCC completers that may fill these openings (four), we arrive at a gap of 86 job openings. There are 175 unique job postings at the associate degree or below for these occupations in Guilford County. The top three posting companies are: Cone Health; Hirerocket, Inc.; and Atrium Health.

ALUMNI IMPACT

Former students of GTCC’s Health Information Technology program added $3.1 thousand in income to the Guilford County economy in FY 2019-20. This figure represents the increased wages collected by former students active today in the county workforce as a direct result of their education, the increased output of businesses that employ these students, and the multiplier effects that occur.

TAXPAYER BENEFITS

Taxpayers will receive an estimated present value of $99.8 thousand in added tax revenue stemming from the students’ higher lifetime earnings and the increased output of businesses. Savings to the public sector add another estimated $6.7 thousand in benefits due to a reduced demand for government-funded social services in North Carolina. Throughout the students’ working lives, North Carolina taxpayers will receive a total of $106.5 thousand in benefits.
The Carpentry (Residential and Commercial) program was established in 1997. In FY 2019-20, GTCC enrolled 26 students in the program. Of these students, three graduated with a certificate in FY 2019-20.

CAREER OUTLOOK

The Carpentry program can lead students into a number of occupations, which may include carpenters; carpenter helpers; and cabinetmakers & bench carpenters. Using the county number of annual openings for these occupations (48) and subtracting the FY 2019-20 GTCC completers that may fill these openings (three), we arrive at a gap of 45 job openings. There are 31 unique job postings at the associate degree or below for these occupations in Guilford County. The top three posting companies are: Custom Surfaces Inc.; Builders Firstsource, Inc.; and Champion Window, Inc.

ALUMNI IMPACT

Former students of GTCC’s Carpentry program added $322.7 thousand in income to the Guilford County economy in FY 2019-20. This figure represents the increased wages collected by former students active today in the county workforce as a direct result of their education, the increased output of businesses that employ these students, and the multiplier effects that occur.

---

14 The Carpentry program is defined by the following CIP code: Carpentry/Carpenter (46.0201).
15 For the purposes of this analysis, only GTCC completers were considered when comparing to annual openings.
STUDENT RETURN ON INVESTMENT

To earn a certificate in the program, students experience costs in the form of tuition and fees, books and supplies, and the opportunity cost of attending school instead of working. In return for this investment, students can earn higher wages. For every dollar students invest in their education in the program, they will receive $3.90 back over the course of their working lives. This investment can also be seen in terms of a rate of return of 35.3%. This is an impressive return, especially when compared to the U.S. stock market 30-year average return of 10.6%.

TAXPAYER BENEFITS

Taxpayers will receive an estimated present value of $118.4 thousand in added tax revenue stemming from the students’ higher lifetime earnings and the increased output of businesses. Savings to the public sector add another estimated $11.5 thousand in benefits due to a reduced demand for government-funded social services in North Carolina. Throughout the students’ working lives, North Carolina taxpayers will receive a total of $129.9 thousand in benefits.
The Diesel and Heavy Equipment Technology program was recently established in 2014. In FY 2019-20, GTCC enrolled 44 students in the program. Of these students, 10 graduated with a certificate in FY 2019-20.

CAREER OUTLOOK

The Diesel and Heavy Equipment Technology program can lead students into a number of occupations, which may include automotive service technicians & mechanics and bus & truck mechanics & diesel engine specialists.

Using the county number of annual openings for these occupations (69) and subtracting the FY 2019-20 GTCC completers that may fill these openings (10), we arrive at a gap of 59 job openings. There are 201 unique job postings at the associate degree or below for these occupations in Guilford County. The top three posting companies are: Guilford County Schools; Carmax, Inc.; and Cummins Inc.

ALUMNI IMPACT

Former students of GTCC’s Diesel and Heavy Equipment Technology program added $62.6 thousand in income to the Guilford County economy in FY 2019-20. This figure represents the increased wages collected by former students active today in the county workforce as a direct result of their education, the increased output of businesses that employ these students, and the multiplier effects that occur.

ALUMNI LIFETIME EARNINGS INCREASE AND IMPACT

Lifetime earnings increase per completer

$348.4 thousand

Total alumni impact in FY 2019-20

$62.6 thousand

16 The Diesel and Heavy Equipment Technology program is defined by the following CIP code: Medium/Heavy Vehicle & Truck Technology/Technician (47.0613).

17 For the purposes of this analysis, only GTCC completers were considered when comparing to annual openings.
STUDENT RETURN ON INVESTMENT

To earn a certificate in the program, students experience costs in the form of tuition and fees, books and supplies, and the opportunity cost of attending school instead of working. In return for this investment, students can earn higher wages. For every dollar students invest in their education in the program, they will receive $4.10 back over the course of their working lives. This investment can also be seen in terms of a rate of return of 16.6%. This is an impressive return, especially when compared to the U.S. stock market 30-year average return of 10.6%.

TAXPAYER BENEFITS

Taxpayers will receive an estimated present value of $490.6 thousand in added tax revenue stemming from the students’ higher lifetime earnings and the increased output of businesses. Savings to the public sector add another estimated $32 thousand in benefits due to a reduced demand for government-funded social services in North Carolina. Throughout the students’ working lives, North Carolina taxpayers will receive a total of $522.6 thousand in benefits.
CHAPTER 3: Methodology

For the purpose of explaining the methodology, one program, Avionics Technology, will be used as an example. The results for each program under study follows the same methodology outlined below.
GTCC provides its Avionics Technology program’s students with the knowledge, skills, and abilities they need to become productive citizens and add to the overall output of the county. In this section, we describe the methodology in calculating the alumni impact, which measures the income added in the county as former students of the program expand the county economy’s stock of human capital.

**Economic impact measures**

When estimating the alumni impact, we measure a net impact, not a gross impact. Gross impact represents an upper-bound estimate in terms of capturing all activity stemming from the alumni; however, a net impact reflects a truer measure since it demonstrates what would not have been generated in the county economy if not for these selected programs at GTCC.

Economic impact analyses use different types of impacts to estimate the results. The impact focused on in this study assesses the change in income. This measure is similar to the commonly used gross regional product (GRP). Income may be further broken out into the **labor income impact**, also known as earnings, which assesses the change in employee compensation; and the **non-labor income impact**, which assesses the change in business profits. Together, labor income and non-labor income sum to total income.

Another way to state the impact is in terms of **jobs**, a measure of the number of full- and part-time jobs that would be required to support the change in income. Finally, a frequently used measure is the **sales impact**, which comprises the change in business sales revenue in the economy as a result of increased economic activity. It is important to bear in mind, however, that much of this sales revenue leaves the county economy through intermediary transactions and costs.18

All of these measures—added labor and non-labor income, total income, jobs, and sales—are used to estimate the economic impact results presented in this chapter. The analysis breaks out the impact measures into different components,

---

18 See Appendix 4 for an example of the intermediary costs included in the sales impact but not in the income impact.
each based on the economic effect that caused the impact. The following is a list of each type of effect presented in this analysis:

- The **initial effect** is the exogenous shock to the economy caused by the initial spending of money, for example, the increased wages of the Avionics Technology program’s alumni.

- The initial round of spending creates more spending in the economy, resulting in what is commonly known as the **multiplier effect**. The multiplier effect comprises the additional activity that occurs across all industries in the economy and may be further decomposed into the following three types of effects:
  
  - The **direct effect** refers to the additional economic activity that occurs as the industries affected by the initial effect spend money to purchase goods and services from their supply chain industries.
  
  - The **indirect effect** occurs as the supply chain of the initial industries creates even more activity in the economy through their own inter-industry spending.
  
  - The **induced effect** refers to the economic activity created by the household sector as the businesses affected by the initial, direct, and indirect effects raise salaries or hire more people.

The terminology used to describe the economic effects listed above differs slightly from that of other commonly used input-output models, such as IMPLAN. For example, the initial effect in this study is called the “direct effect” by IMPLAN, as shown in the table below. Further, the term “indirect effect” as used by IMPLAN refers to the combined direct and indirect effects defined in this study. To avoid confusion, readers are encouraged to interpret the results presented in this chapter in the context of the terms and definitions listed above. Note that, regardless of the effects used to decompose the results, the total impact measures are analogous.

<table>

<td>Induced</td>
<td></td>
</tr>
</tbody>
</table>

Multiplier effects in this analysis are derived using Emsi Burning Glass Multi-Regional Social Accounting Matrix (MR-SAM) input-output model that captures the interconnection of industries, government, and households in the county. The Emsi Burning Glass MR-SAM contains approximately 1,000 industry sectors at the highest level of detail available in the North American Industry Classification System (NAICS) and supplies the industry-specific multipliers required to determine the impacts associated with increased activity within a given economy. The multi-regional capacity of the MR-SAM allows impacts to be measured in the county and state simultaneously, taking into account the
program's activity in each area, as well as each area’s economic characteristics. In this analysis, impacts on the region include impacts from the program’s county activity, as well as the indirect and induced multiplier effects that reach the county from the program's activity in the rest of the state. For more information on the Emsi Burning Glass MR-SAM model and its data sources, see Appendix 5.

More specifically, this report analyzes the economic impact attributable to the alumni of the college’s Avionics Technology program. In order to capture the impact at the program level, we must map the program to the occupations students are likely to enter upon completion of the program. This is done by mapping the Classification of Instructional Programs (CIP) code for the program to the appropriate Standard Occupational Classification (SOC) codes and then to the appropriate industries. CIP codes are how the National Center for Education Statistics (NCES) categorizes and tracks an enrollee’s field of study. SOC codes are used by the Bureau of Labor Statistics (BLS) to categorize and track employment trends for jobs with similar duties, skills, and/or education. The link between CIPs and SOCs was provided by Emsi Burning Glass and reviewed by GTCC (Appendix 1). This mapping provides the basis for calculating and attributing earnings to a program. However, not all students in the program will enter these mapped occupations. Some students will enter occupations outside their field of study. Using student data from other colleges and Emsi Burning Glass profiles data, Emsi Burning Glass calculated the percentage of students working in-field and out-of-field by SOC code. The mapped occupation specific earnings are then weighted by the average county earnings from the proportion of program students that work out-of-field. For example, if 60% of program students are estimated to work in-field, then the average earnings will be weighted by 60% mapped occupation earnings and 40% average county earnings.

From the CIP to SOC mapping, we use an inverse staffing pattern to determine the industries currently employing the occupations. This is done in the Emsi Burning Glass MR-SAM by combining data from the national Occupational Employment Statistics (OES) staffing pattern, projections from the National Industry-Occupation Employment Matrix, and Emsi Burning Glass’s proprietary employment data.

Alumni impact analysis

In this section, we estimate the economic impact stemming from the added labor income of Avionics Technology program alumni in combination with their employers’ added non-labor income. This impact is based on the number of students who have attended GTCC’s Avionics Technology program throughout its history. We then use this total number to consider the impact of those students in the single FY 2019-20. Former students who earned a degree as well as those who may not have finished their degree or did not take courses for credit are considered alumni.
While attending GTCC’s Avionics Technology program, students gain experience, education, and the knowledge, skills, and abilities that increase their productivity and allow them to command a higher wage once they enter the workforce. But the reward of increased productivity does not stop there. Talented professionals make capital more productive too (e.g., buildings, production facilities, equipment). The employers of GTCC’s Avionics Technology program’s alumni enjoy the fruits of this increased productivity in the form of additional non-labor income (i.e., higher profits).

The alumni impact is the result of years of past instruction and the associated accumulation of human capital. The initial effect of alumni is comprised of two main components. The first and largest of these is the added labor income of GTCC’s former students. The second component of the initial effect is comprised of the added non-labor income of the businesses that employ the former students of the Avionics Technology program.

We begin by estimating the portion of the program’s alumni who are employed in the workforce. To estimate the historical employment patterns of alumni in the county, we use the following sets of data or assumptions: 1) settling-in factors to determine how long it takes the average student to settle into a career;\textsuperscript{19} 2) death, retirement, and unemployment rates from the National Center for Health Statistics, the Social Security Administration, and the Bureau of Labor Statistics; and 3) state migration data from the Internal Revenue Service. The result is the estimated portion of alumni from each previous year who were still actively employed in the county as of FY 2019-20.

The next step is to quantify the skills and human capital that alumni of the Avionics Technology program acquired from the college. We use the students’ production of CHEs as a proxy for accumulated human capital. The average number of CHEs completed per student in FY 2019-20 was 13.7. To estimate the number of CHEs present in the workforce during the analysis year, we use the college’s historical Avionics Technology program’s student headcount over the past nine years, from FY 2011-12 to FY 2019-20.\textsuperscript{20} We multiply the 13.7 average CHEs per student by the headcounts that we estimate are still actively employed from each of the previous years.\textsuperscript{21} Students who enroll in the program at the college more than one year are counted at least twice in the historical enrollment data. However, CHEs remain distinct regardless of when and by whom they were earned, so there is no duplication in the CHE counts. We estimate there are approximately 2,646 CHEs from program alumni active in the workforce.

\textsuperscript{19} Settling-in factors are used to delay the onset of the benefits to students in order to allow time for them to find employment and settle into their careers. In the absence of hard data, we assume a range between one and three years for students who graduate with a certificate or a degree, and between one and five years for returning students.

\textsuperscript{20} The nine-year time horizon is equal to the number of years that GTCC’s Avionics Technology program was in operation since it was established in FY 2011-12.

\textsuperscript{21} This assumes the average credit load and level of study from past years is equal to the credit load and level of study of students today.
Next, we estimate the value of the CHEs, or the skills and human capital acquired by alumni of the Avionics Technology program. This is done using the incremental added labor income stemming from the students' higher wages. The incremental added labor income is the difference between the wage earned by the Avionics Technology program's alumni and the alternative wage they would have earned had they not attended the program. To calculate the wage earned by the Avionics Technology program's alumni, we use a CIP to SOC mapping and the earnings associated with the occupations students of the Avionics Technology program are likely to enter. For multiple occupations, we use a weighted average by annual job openings to calculate the likely average earnings of workers in occupations mapped to the Avionics Technology program. This is then adjusted to reflect each education level. Note that for workers with only a high school diploma or who have not achieved a high school diploma, the earnings are weighted by the average earnings for people with that level of education in the county; in other words, the adjustment is dampened.

Using the county incremental earnings and distribution of credits completed, we estimate the program's average value per CHE to equal $138. This value represents the county average incremental increase in wages that alumni of the Avionics Technology program received during the analysis year for every CHE they completed.

Because workforce experience leads to increased productivity and higher wages, the value per CHE varies depending on the students' workforce experience, with the highest value applied to the CHEs of students who had been employed the longest by FY 2019-20, and the lowest value per CHE applied to students who were just entering the workforce. More information on the theory and calculations behind the value per CHE appears in Appendix 6. In determining the amount of added labor income attributable to alumni, we multiply the CHEs of former students in each year of the historical time horizon by the corresponding average value per CHE for that year, and then sum the products together. This calculation yields approximately $364.1 thousand in gross labor income from increased wages received by former students in FY 2019-20 (as shown in Table 3.1).

Source: Emsi Burning Glass impact model.
The next two rows in Table 3.1 show two adjustments used to account for counterfactual outcomes. Counterfactual outcomes in economic analysis represent what would have happened if a given event had not occurred. The event in question is the education and training provided by GTCC’s Avionics Technology program and subsequent influx of skilled labor into the county economy. The first counterfactual scenario that we address is the adjustment for alternative education opportunities. In the counterfactual scenario where the program does not exist, we assume a portion of the program’s alumni would have received a comparable education elsewhere in the county or would have left the county and received a comparable education and then returned to the county. The incremental added labor income that accrues to those students cannot be counted towards the added labor income from the Avionics Technology program’s alumni. The adjustment for alternative education opportunities amounts to a 15% reduction of the $364.1 thousand in added labor income. This means that 15% of the added labor income from GTCC’s Avionics Technology program alumni would have been generated in the county anyway, even if the program did not exist. For more information on the alternative education adjustment, see Appendix 7.

The other adjustment in Table 3.1 accounts for the importation of labor. Suppose the Avionics Technology program did not exist and in consequence there were fewer skilled workers in the county. Businesses could still satisfy some of their need for skilled labor by recruiting from outside Guilford County. We refer to this as the labor import effect. Lacking information on its possible magnitude, we assume 50% of the jobs that students fill at county businesses could have been filled by workers recruited from outside the county if the Avionics Technology program did not exist. Consequently, the gross labor income must be adjusted to account for the importation of this labor, since it would have happened regardless of the presence of the program. We conduct a sensitivity analysis for this assumption in Appendix 2. With the 50% adjustment, the net added labor income added to the economy comes to $154.7 thousand, as shown in Table 3.1.

The $154.7 thousand in added labor income appears under the initial effect in the labor income column of Table 3.2. To this we add an estimate for initial non-labor income. As discussed earlier in this section, businesses that employ former students of GTCC’s Avionics Technology program see higher profits as a result of the increased productivity of their capital assets. To estimate this additional income, we allocate the initial increase in labor income ($154.7 thousand) to the six-digit NAICS industry sectors where students exiting the program are most likely to be employed. This allocation entails a process that maps the Avionics Technology program to the detailed occupations for which those completers have been trained, and then maps the detailed occupations to the six-digit industry sectors in the MR-SAM model. Finally, we apply a matrix of wages by industry and by occupation from the MR-SAM model to map the occupational

---
22 A similar assumption is used by Walden (2014) in his analysis of the Cooperating Raleigh Colleges.
distribution of the $154.7 thousand in initial labor income effects to the detailed industry sectors in the MR-SAM model.23

Once these allocations are complete, we apply the ratio of non-labor to labor income provided by the MR-SAM model for each sector to our estimate of initial labor income. This computation yields an estimated $80.9 thousand in added non-labor income attributable to alumni of the college’s Avionics Technology program. Summing initial labor and non-labor income together provides the total initial effect of alumni productivity in the Guilford County economy, equal to approximately $235.7 thousand. To estimate multiplier effects, we convert the industry-specific income figures generated through the initial effect to sales using sales-to-income ratios from the MR-SAM model. We then run the values through the MR-SAM’s multiplier matrix.

Table 3.2 shows the multiplier effects of the Avionics Technology program’s alumni. Multiplier effects occur as alumni generate an increased demand for consumer goods and services through the expenditure of their higher wages. Further, as the industries where alumni are employed increase their output, there is a corresponding increase in the demand for input from the industries in the employers’ supply chain. Together, the incomes generated by the expansions in business input purchases and household spending constitute the multiplier effect of the increased productivity of the program’s alumni. The final results are $96.2 thousand in added labor income and $52.6 thousand in added non-labor income, for an overall total of $148.8 thousand in multiplier effects. The grand total of the alumni impact is $384.5 thousand in total added income, the sum of all initial and multiplier labor and non-labor income effects. This is equivalent to supporting four jobs.

Source: Emsi Burning Glass impact model.

23 For example, if the MR-SAM model indicates that 20% of wages paid to workers in SOC 51-4121 (Welders) occur in NAICS 332313 (Plate Work Manufacturing), then we allocate 20% of the initial labor income effect under SOC 51-4121 to NAICS 332313.
Investment analysis is the process of evaluating total costs and measuring these against total benefits to determine whether or not a proposed venture will be profitable. If benefits outweigh costs, then the investment is worthwhile. If costs outweigh benefits, then the investment will lose money and is thus considered infeasible.

To enroll in postsecondary education, the Avionics Technology program’s students pay money for tuition and forego monies that otherwise they would have earned had they chosen to work instead of learn. From the perspective of students, education is the same as an investment; i.e., they incur a cost, or put up a certain amount of money, with the expectation of receiving benefits in return. The total costs consist of the tuition and fees that students pay and the opportunity cost of foregone time and money. The benefits are the higher earnings that students receive as a result of their education.

**Calculating student costs**

Avionics Technology program student costs consist of three main items: direct outlays, opportunity costs, and future principal and interest costs incurred from student loans. Direct outlays include tuition and fees, equal to $42.4 thousand. Direct outlays also include the cost of books and supplies. On average, full-time students spent $1,096 each on books and supplies during the reporting year.\(^{24}\) Multiplying this figure by the number of full-time equivalents (FTEs) produced by the program in FY 2019-20\(^{25}\) generates a total cost of $45.8 thousand for books and supplies.

In order to pay the cost of tuition, many students had to take out loans. These students not only incur the cost of tuition from the college but also incur the interest cost of taking out loans. In FY 2019-20, students received a total of $251.2 thousand in federal loans to attend GTCC.\(^{26}\) Students pay back these loans along

---

\(^{24}\) Based on data provided by GTCC.

\(^{25}\) A single FTE is equal to 30 CHEs, so there were 29 FTEs produced by students in FY 2019-20, equal to 876 CHEs divided by 30.

\(^{26}\) Due to data limitations, only federal loans are considered in this analysis.
with interest over the span of several years in the future. Since students pay off these loans over time, they accrue no initial cost during the analysis year. Hence, to avoid double counting, the $251.2 thousand in federal loans is subtracted from the costs incurred by students in FY 2019-20.

In addition to the cost of tuition, books, and supplies, Avionics Technology program students also experienced an opportunity cost of attending college during the analysis year. Opportunity cost is the most difficult component of student costs to estimate. It measures the value of time and earnings foregone by students who attend the program’s classes rather than work. To calculate it, we need to know the difference between the students’ full earning potential and what they actually earn while enrolled in the program.

We derive the students’ full earning potential by weighting the average annual earnings levels according to the education level breakdown of the student population at the start of the analysis year. However, the earnings levels reflect what average workers earn at the midpoint of their careers, not while attending the college. Because of this, we adjust the earnings levels to the average age of the program’s student population (27) to better reflect their wages at their current age. This calculation yields an average full earning potential of $32,166 per student.

In determining how much students earn while enrolled in postsecondary education, an important factor to consider is the time that they actually spend on postsecondary education, since this is the only time that they are required to give up a portion of their earnings. We use the CHE production of the Avionics Technology program’s students as a proxy for time, under the assumption that the more CHEs students earn, the less time they have to work, and, consequently, the greater their foregone earnings. Overall, students attending GTCC in FY 2019-20 earned an average of 13.7 CHEs per student, which is approximately equal to 46% of a full academic year. We thus include no more than $14,676 (or 46%) of the students’ full earning potential in the opportunity cost calculations.

Another factor to consider is the employment status of the Avionics Technology program’s students while enrolled in postsecondary education. It is estimated that 54% of students are employed. For the remainder of students, we assume that they are either seeking work or planning to seek work once they complete their educational goals. By choosing to enroll, therefore, non-working students give up everything that they can potentially earn during the academic year (i.e., the $14,676). The total value of their foregone earnings thus comes to $432.1 thousand.

Working students are able to maintain all or part of their earnings while enrolled. However, many of them hold jobs that pay less than statistical averages, usually because those are the only jobs they can find that accommodate their course

---

27 This is based on students who reported their prior level of education to GTCC.
28 Further discussion on this adjustment appears in Appendix 6.
29 Equal to 13.7 CHEs divided by 30, the assumed number of CHEs in a full-time academic year.
30 Based on data provided by GTCC.
schedule. These jobs tend to be at entry level, such as restaurant servers or cashiers. To account for this, we assume that working students hold jobs that pay 71% of what they would have earned had they chosen to work full-time rather than go to college. The remaining 29% comprises the percentage of their full earning potential that they forego. Obviously this assumption varies by person; some students forego more and others less. Since we do not know the actual jobs that students hold while attending, the 29% in foregone earnings serves as a reasonable average.

Working students of the program also give up a portion of their leisure time in order to attend higher education institutions. According to the Bureau of Labor Statistics American Time Use Survey, students forego up to 0.5 hours of leisure time per day. Assuming that an hour of leisure is equal in value to an hour of work, we derive the total cost of leisure by multiplying the number of leisure hours foregone during the academic year by the average hourly pay of the students’ full earning potential. For working students, therefore, their total opportunity cost is $182.8 thousand, equal to the sum of their foregone earnings ($149.4 thousand) and foregone leisure time ($33.3 thousand).

Thus far we have discussed student costs during the analysis year. However, recall that students take out student loans to attend college during the year, which they will have to pay back over time. The amount they will be paying in the future must be a part of their decision to attend the college today. Students who take out loans are not only required to pay back the principal of the loan but to also pay back a certain amount in interest. The first step in calculating students’ loan interest cost is to determine the payback time for the loans. The $251.2 thousand in loans was awarded to 37 students, averaging $6,789 per student in the analysis year. However, this figure represents only one year of loans. Because loan payback time is determined by total indebtedness, we assume that since GTCC is a two-year college, students will be indebted twice that amount, or $13,578 on average. According to the U.S. Department of Education, this level of indebtedness will take 15 years to pay back under the standard repayment plan.

This indebtedness calculation is used solely to estimate the loan payback period. Students will be paying back the principal amount of $251.2 thousand over time. After taking into consideration the time value of money, this means that students will pay off a discounted present value of $172.9 thousand in principal over the 15 years. In order to calculate interest, we only consider interest on the federal loans awarded to students in FY 2019–20. Using the student discount rate of 4.5% as

31 The 71% assumption is based on the average hourly wage of jobs commonly held by working students divided by the national average hourly wage. Occupational wage estimates are published by the Bureau of Labor Statistics (see http://www.bls.gov/oes/current/oes_nat.htm).
34 The student discount rate is derived from the baseline forecasts for the 10-year discount rate published by the Congressional Budget Office. See the Congressional Budget Office, Student Loan and Pell Grant Programs—March 2020 Baseline. https://www.cbo.gov/system/files/2020-03/51310-2020-03-studentloan.pdf.
our interest rate, we calculate that students will pay a total discounted present value of $74.7 thousand in interest on student loans throughout the first 15 years of their working lifetime. The stream of these future interest costs together with the stream of loan payments is included in the costs of Column 5 of Table 3.4.

The steps leading up to the calculation of the Avionics Technology program’s student costs appear in Table 3.3. Direct outlays amount to the sum of tuition and fees ($42.4 thousand) and books and supplies ($45.8 thousand), less federal loans received ($251.2 thousand). Opportunity costs for working and non-working students amount to $529.3 thousand, excluding $85.5 thousand in offsetting residual aid that is paid directly to students. Finally, we have the present value of future student loan costs, amounting to $247.6 thousand between principal and interest. Summing direct outlays, opportunity costs, and future student loan costs together yields a total of $614 thousand in present value student costs.

**Linking education to earnings**

Having estimated the costs of education to students of the Avionics Technology program, we weigh these costs against the benefits that students receive in return. The relationship between education and earnings is well documented and forms the basis for determining student benefits. State mean earnings levels

---

35 Residual aid is the remaining portion of scholarship or grant aid distributed directly to a student after the college applies tuition and fees.
at the midpoint of the average-aged worker’s career increase as people achieve higher levels of education. The differences between state earnings levels define the incremental benefits of moving from one education level to the next.

A key component in determining the students’ return on investment is the value of their future benefits stream; i.e., what they can expect to earn in return for the investment they make in education. We calculate the future benefits stream to the college’s FY 2019-20 Avionics Technology program’s students first by determining their average annual increase in earnings, equal to $205,600 thousand. This value represents the higher wages that accrue to students at the midpoint of their careers and is calculated based on the marginal wage increases of the CHEs that students complete while enrolled in the program. Using the state of North Carolina earnings, the marginal wage increase per CHE is $235. For a full description of the methodology used to derive the $205,600 thousand, see Appendix 6.

The second step is to project the $205,600 thousand annual increase in earnings into the future, for as long as students remain in the workforce. We do this using the Mincer function to predict the change in earnings at each point in an individual’s working career. The Mincer function originated from Mincer’s seminal work on human capital (1958). The function estimates earnings using an individual’s years of education and post-schooling experience. While some have criticized Mincer’s earnings function, it is still upheld in recent data and has served as the foundation for a variety of research pertaining to labor economics. Card (1999 and 2001) addresses a number of these criticisms using U.S. based research over the last three decades and concludes that any upward bias in the Mincer parameters is on the order of 10% or less. We use state-specific and education level-specific Mincer coefficients. To account for any upward bias, we incorporate a 10% reduction in our projected earnings, otherwise known as the ability bias. With the $205,600 thousand representing the students’ higher earnings at the midpoint of their careers, we apply scalars from the Mincer function to yield a stream of projected future benefits that gradually increase from the time students enter the workforce, peak shortly after the career midpoint, and then dampen slightly as students approach retirement at age 67. This earnings stream appears in Column 2 of Table 3.4.

As shown in Table 3.4, the $205,600 thousand in gross higher earnings occurs around Year 14, which is the approximate midpoint of the students’ future working careers given the average age of the student population and an assumed retirement age of 67. In accordance with the Mincer function, the gross higher earnings that accrue to students in the years leading up to the midpoint are less than $205,600 thousand and the gross higher earnings in the years after the midpoint are greater than $205,600 thousand. On a per student basis, the total increase in lifetime earnings of students that complete the program is $684,200 thousand (Figure 3.1).

The final step in calculating the future benefits stream of the Avionics Technology program’s students is to net out the potential benefits generated by students who are either not yet active in the workforce or who leave the workforce over time. This adjustment appears in Column 3 of Table 3.4 and represents the percentage of the FY 2019-20 Avionics Technology program student population that will be employed in the workforce in a given year. Note that the percentages in the first five years of the time horizon are relatively lower than those in subsequent years. This is because many students delay their entry into the workforce, either because they are still enrolled at the college or because they are unable to find a job immediately upon graduation. Accordingly, we apply a set of “settling-in” factors to account for the time needed by students to find employment and settle into their careers. As discussed earlier, settling-in factors delay the onset of the benefits by one to three years for students who graduate with a certificate or a degree and by one to five years for degree-seeking students who do not complete during the analysis year.

Beyond the first five years of the time horizon, students will leave the workforce for any number of reasons, whether death, retirement, or unemployment. We estimate the rate of attrition using the same data and assumptions applied in the calculation of the attrition rate in the alumni impact analysis. The likelihood of leaving the workforce increases as students age, so the attrition rate is more aggressive near the end of the time horizon than in the beginning. Column 4 of Table 3.4 shows the net higher earnings to students after Avionics Technology for both the settling-in patterns and attrition.

Figure 3.1: LIFETIME EARNINGS OF AN AVIONICS TECHNOLOGY PROGRAM COMPLETER COMPARED TO A HIGH SCHOOL GRADUATE

Source: Emsi Burning Glass impact model.

The sources for deriving the attrition rate are the National Center for Health Statistics, the Social Security Administration, and the Bureau of Labor Statistics. Note that we do not account for migration patterns in the student investment analysis because the higher earnings that students receive as a result of their education will accrue to them regardless of where they find employment.
Return on investment to students

Having estimated the students’ costs and their future benefits stream for the Avionics Technology program’s students, the next step is to discount the results to the present to reflect the time value of money. We assume a discount rate of 4.5% (see below). Because students tend to rely upon debt to pay for education—i.e. they are negative savers—their discount rate is based upon student loan interest rates. In Appendix 2, we conduct a sensitivity analysis of this discount rate. The present value of the benefits is then compared to student costs to derive the investment analysis results, expressed in terms of a benefit-cost ratio, rate of return, and payback period. The investment is feasible if returns match or exceed the minimum threshold values; i.e., a benefit-cost ratio greater than 1.0, a rate of return that exceeds the discount rate, and a reasonably short payback period.

Discount rate

The discount rate is a rate of interest that converts future costs and benefits to present values. For example, $1,000 in higher earnings realized 30 years in the future is worth much less than $1,000 in the present. All future values must therefore be expressed in present value terms in order to compare them with investments (i.e., costs) made today. The selection of an appropriate discount rate, however, can become an arbitrary and controversial undertaking. As suggested in economic theory, the discount rate should reflect the investor’s opportunity cost of capital, i.e., the rate of return one could reasonably expect to obtain from alternative investment schemes. In this study we assume a 4.5% discount rate from the student perspective and a 0.4% discount rate from the perspective of taxpayers.

In Table 3.4, the net higher earnings of students yield a cumulative discounted sum of approximately $3.1 million, the present value of all of the future earnings increments (see the bottom section of Column 4). This may also be interpreted as the gross capital asset value of the students’ higher earnings stream. In effect, the aggregate FY 2019–20 student body is rewarded for its investment in GTCC’s Avionics Technology program with a capital asset valued at $3.1 million.

The Avionics Technology program’s students’ cost is shown in Column 5 of Table 3.4, equal to a present value of $614 thousand. Comparing the cost with the present value of benefits yields a student benefit-cost ratio of 5.0 (equal to $3.1 million in benefits divided by $614 thousand in costs).

Another way to compare the same benefits stream and associated cost is to compute the rate of return. The rate of return indicates the interest rate that a bank would have to pay a depositor to yield an equally attractive stream of

38 The student discount rate is derived from the baseline forecasts for the 10-year Treasury rate published by the Congressional Budget Office. See the Congressional Budget Office, Student Loan and Pell Grant Programs—March 2020 Baseline. https://www.cbo.gov/system/files/2020-03/51310-2020-03-studentloan.pdf.
Table 3.4 shows students of the Avionics Technology program earning average returns of 21.3% on their investment of time and money. This is a favorable return compared, for example, to approximately 1% on a standard bank savings account, or 10% on stocks and bonds (30-year average return).

Note that returns reported in this study are real returns, not nominal. When a bank promises to pay a certain rate of interest on a savings account, it employs an implicitly nominal rate. Bonds operate in a similar manner. If it turns out that the inflation rate is higher than the stated rate of return, then money is lost in real terms. In contrast, a real rate of return is on top of inflation. For example, if inflation is running at 3% and a nominal percentage of 5% is paid, then the real rate of return on the investment is only 2%. In Table 3.4, the 21.3% student rate of return is a real rate. With an inflation rate of 2.1% (the average rate reported over the past 20 years as per the U.S. Department of Commerce, Consumer Price Index), the corresponding nominal rate of return is 23.3%, higher than what is reported in Table 3.4.

The payback period is defined as the length of time it takes to entirely recoup the initial investment. Beyond that point, returns are what economists would call pure costless rent. As indicated in Table 3.4, students at GTCC see, on average, a payback period of 6.3 years, meaning 6.3 years after their initial investment of foregone earnings and out-of-pocket costs, they will have received enough higher future earnings to fully recover those costs.

GTCC’s Avionics Technology program students see an average rate of return of 21.3% for their investment of time and money.

---

39 Rates of return are computed using the familiar internal rate-of-return calculation. Note that, with a bank deposit or stock market investment, the depositor puts up a principal, receives in return a stream of periodic payments, and then recovers the principal at the end. Someone who invests in education, on the other hand, receives a stream of periodic payments that include the recovery of the principal as part of the periodic payments, but there is no principal recovery at the end. These differences notwithstanding comparable cash flows for both bank and education investors yield the same internal rate of return.

40 Payback analysis is generally used by the business community to rank alternative investments when safety of investments is an issue. Its greatest drawback is it does not take into account the time value of money. The payback period is calculated by dividing the cost of the investment by the net return per period. In this study, the cost of the investment includes tuition and fees plus the opportunity cost of time; it does not take into account student living expenses.
From the taxpayer perspective, the pivotal step is to determine the public benefits that specifically accrue to state government. For example, benefits resulting from earnings growth are limited to increased state tax payments. Similarly, savings related to improved health, reduced crime, and fewer welfare and unemployment claims, discussed below, are limited to those received strictly by state government. In all instances, benefits to private residents, local businesses, or the federal government are excluded.

**Growth in state tax revenues**

As a result of their time in GTCC’s Avionics Technology program, students earn more because of the skills they learned while enrolled in the program, and businesses earn more because student skills make capital more productive (buildings, machinery, and everything else). This in turn raises profits and other business property income. Together, increases in labor and non-labor (i.e., capital) income are considered the effect of a skilled workforce. These in turn increase tax revenues since state government is able to apply tax rates to higher earnings.

Estimating the effect of GTCC’s Avionics Technology program on increased tax revenues begins with the present value of the students’ future earnings stream, which is displayed in Column 4 of Table 3.4. To these net higher earnings, we apply a multiplier derived from Emsi Burning Glass’s MR-SAM model to estimate the added labor income created in the state as students and businesses spend their higher earnings. As labor income increases, so does non-labor income, which consists of monies gained through investments. To calculate the growth in non-labor income, we multiply the increase in labor income by a ratio of the North Carolina gross state product to total labor income in the state.

Not all of these tax revenues may be counted as benefits to the state, however. Some students leave the state during the course of their careers, and the higher earnings they receive as a result of their education leaves the state with them. To account for this dynamic, we combine program student settlement data from

---

41 For a full description of the Emsi Burning Glass MR-SAM model, see Appendix 5.
the college with data on migration patterns from the Internal Revenue Service to estimate the number of students who will leave the state workforce over time.

We apply another reduction factor to account for the students' alternative education opportunities. This is the same adjustment that we use in the calculation of the alumni impact and is designed to account for the counterfactual scenario where the Avionics Technology program does not exist. The assumption in this case is that any benefits generated by students who could have received an education even without the program cannot be counted as new benefits to taxpayers. For this analysis, we assume an alternative education variable of 15%, meaning that 15% of the Avionics Technology program student population would have generated benefits anyway even without the program. For more information on the alternative education variable, see Appendix 7.

After adjusting for attrition and alternative education opportunities, we calculate the present value of the future added tax revenues that occur in the state, equal to $1 million. Recall from the discussion of the student return on investment that the present value represents the sum of the future benefits that accrue each year over the course of the time horizon, discounted to current year dollars to account for the time value of money. Given that the stakeholder in this case is the public sector, we use the discount rate of 0.4%. This is the real treasury interest rate recommended by the Office of Management and Budget (OMB) for 30-year investments, and in Appendix 2, we conduct a sensitivity analysis of this discount rate.42

**Government savings**

In addition to the creation of higher tax revenues to the state government, education is statistically associated with a variety of lifestyle changes that generate social savings, also known as external or incidental benefits of education. These represent the avoided costs to the government that otherwise would have been drawn from public resources absent the education provided by GTCC. Government savings appear in Figure 3.2 and Table 3.5 and break down into three main categories: 1) health savings, 2) crime savings, and 3) income assistance savings. Health savings include avoided medical costs that would have otherwise been covered by state government. Crime savings consist of avoided costs to the justice system (i.e., police protection, judicial and legal, and corrections). Income assistance benefits comprise avoided costs due to the reduced number of welfare and unemployment insurance claims.

The model quantifies government savings by calculating the probability at each education level that individuals will have poor health, commit crimes, or

claim welfare and unemployment benefits. Deriving the probabilities involves assembling data from a variety of studies and surveys analyzing the correlation between education and health, crime, and income assistance at the national and state level. We spread the probabilities across the education ladder and multiply the marginal differences by the number of students who achieved CHEs at each step. The sum of these marginal differences counts as the upper bound measure of the number of students who, due to the education they received from the program, will not have poor health, commit crimes, or demand income assistance. We dampen these results by the ability bias adjustment discussed earlier in the student perspective section and in Appendix 6 to account for factors (besides education) that influence individual behavior. We then multiply the marginal effects of education times the associated costs of health, crime, and income assistance. Finally, we apply the same adjustments for attrition and alternative education to derive the net savings to the government. Total government savings appear in Figure 3.2 and sum to $47.8 thousand.

Table 3.5 displays all benefits to taxpayers. The first row shows the added tax revenues created in the state, equal to $1 million, from students’ higher earnings and increases in non-labor income. The sum of the government savings and the added income in the state is $1.1 million, as shown in the bottom row of Table 3.5. These savings continue to accrue in the future as long as the FY 2019-20 student population of GTCC remains in the workforce.

APPENDIX 2: SENSITIVITY ANALYSIS

Sensitivity analysis measures the extent to which a model’s outputs are affected by hypothetical changes in the background data and assumptions. This is especially important when those variables are inherently uncertain. This analysis allows us to identify a plausible range of potential results that would occur if the value of any of the variables is in fact different from what was expected. In this appendix we test the sensitivity of the model to the following input factors: 1) the alternative education variable, 2) the labor import effect variable, 3) the student employment variables, 4) and the discount rate.

Alternative education variable

The alternative education variable (15%) accounts for the counterfactual scenario where students would have to seek a similar education elsewhere absent the Avionics Technology program at the college in the county. Given the difficulty in accurately specifying the alternative education variable, we test the sensitivity of the taxpayer benefits analysis results to its magnitude. Variations in the alternative education assumption are calculated around base case results listed in the middle column of Table A2.1. Next, the model brackets the base case assumption on either side with a plus or minus 10%, 25%, and 50% variation in assumptions. Analyses are then repeated introducing one change at a time, holding all other variables constant. For example, an increase of 10% in the alternative education assumption (from 15% to 17%) reduces the taxpayer present value benefits from $1.1 million to $1 million. Likewise, a decrease of 10% (from 15% to 14%) in the assumption increases the present value benefits from $1.1 million to $1.1 million.

Based on this sensitivity analysis, the conclusion can be drawn that GTCC’s Avionics Technology program taxpayer benefits analysis results are not very sensitive to relatively large variations in the alternative education variable. The conclusion is that although the assumption is difficult to specify, its impact on taxpayer benefits is not very sensitive.

Labor import effect variable

The labor import effect variable only affects the alumni impact calculation in Table 3.2. In the model we assume a labor import effect variable of 50%, which means that 50% of the county’s labor demands would have been satisfied without the presence of GTCC. In other words, businesses that hired GTCC students could have substituted some of these workers with equally-qualified people from outside the county had there been no GTCC students to hire. Therefore, we attribute only the remaining 50% of the initial labor income generated by increased alumni productivity to the program.

Table A2.2 presents the results of the sensitivity analysis for the labor import effect variable. As explained earlier, the assumption increases and decreases relative to the base case of 50%
range from a high of $576.8 thousand at a -50% variation to a low of $192.3 thousand at a +50% variation from the base case assumption. This means that if the labor import effect variable increases, the impact that we claim as attributable to alumni decreases. Even under the most conservative assumptions, the alumni impact on the Guilford County economy remains sizeable.

**Student employment variables**

Student employment variables are difficult to estimate because many students do not report their employment status or because colleges generally do not collect this kind of information. Employment variables include the following: 1) the percentage of students who are employed while enrolled in the program at the college and 2) the percentage of earnings that working students receive relative to the earnings they would have received had they not chosen to attend the college. Both employment variables affect the investment analysis results from the student perspective.

Students incur substantial expense by attending GTCC because of the time they spend not gainfully employed. Some of that cost is recaptured if students remain partially (or fully) employed while attending. It is estimated that 54% of students are employed. This variable is tested in the sensitivity analysis by changing it first to 100% and then to 0%.

The second student employment variable is more difficult to estimate. In this study we estimate that students who are working while enrolled in the Avionics Technology program at the college earn only 71%, on average, of the earnings that they statistically would have received if not attending GTCC. This suggests that many students hold part-time jobs that accommodate their GTCC attendance, though it is at an additional cost in terms of receiving a wage that is less than what they otherwise might make. The 71% variable is an estimation based on the average hourly wages of the most common jobs held by students while

enrolled in the program at the college relative to the average hourly wages of all occupations in the U.S. The model captures this difference in wages and counts it as part of the opportunity cost of time. As above, the 71% estimate is tested in the sensitivity analysis by changing it to 100% and then to 0%. The changes generate results summarized in Table A2.3, with A defined as the percent of students employed and B defined as the percent that students earn relative to their full earning potential. Base case results appear in the shaded row; here the assumptions remain unchanged, with A equal to 54% and B equal to 71%. Sensitivity analysis results are shown in non-shaded rows. Scenario 1 increases A to 100% while holding B constant, Scenario 2 increases B to 100% while holding A constant, Scenario 3 increases both A and B to 100%, and Scenario 4 decreases both A and B to 0%.

- **Scenario 1**: Increasing the percentage of students employed (A) from 54% to 100%, the net present value, internal rate of return, and benefit-cost ratio improve to $2.7 million, 46.0%, and 9.1, respectively, relative to base case results. Improved results are attributable to a lower opportunity cost of time; all students are employed in this case.

- **Scenario 2**: Increasing earnings relative to statistical averages (B) from 71% to 100%, the net present value, internal rate of return, and benefit-cost ratio results improve to $2.6 million, 28.6%, and 6.6, respectively, relative to base case results; a strong improvement, again attributable to a lower opportunity cost of time.

- **Scenario 3**: Increasing both assumptions A and B to 100% simultaneously and internal rate of return, and benefit-cost ratio improve yet further to $3 million and 50.4, respectively, relative to base case results. This scenario assumes that all students are fully employed and earning full salaries (equal to statistical averages) while attending classes.

- **Scenario 4**: Finally, decreasing both A and B to 0% reduces the net present value, internal rate of return, and benefit-cost ratio to $2.1 million, 14.4%, and 3.3, respectively, relative to base case results. These results are reflective of an increased opportunity cost; none of the students are employed in this case.

---

45 Note that reducing the percent of students employed to 0% automatically negates the percent they earn relative to full earning potential, since none of the students receive any earnings in this case.
It is strongly emphasized in this section that base case results are very attractive in that results are all above their threshold levels. As is clearly demonstrated here, results of the first three alternative scenarios appear much more attractive, although they overstate benefits. Results presented in Chapter 3 are realistic, indicating that investments in GTCC generate excellent returns, well above the long-term average percent rates of return in stock and bond markets.

**Discount rate**

The discount rate is a rate of interest that converts future monies to their present value. In investment analysis, the discount rate accounts for two fundamental principles: 1) the time value of money, and 2) the level of risk that an investor is willing to accept. Time value of money refers to the value of money after interest or inflation has accrued over a given length of time. An investor must be willing to forego the use of money in the present to receive compensation for it in the future. The discount rate also addresses the investors’ risk preferences by serving as a proxy for the minimum rate of return that the proposed risky asset must be expected to yield before the investors will be persuaded to invest in it. Typically, this minimum rate of return is determined by the known returns of less risky assets where the investors might alternatively consider placing their money.

</tbody>
</table>

Note: A = percent of students employed; B = percent earned relative to statistical averages.

* In this scenario, costs are so low that it is not appropriate to measure an internal rate of return.

In this study, we assume a 4.5% discount rate for students and a 0.4% discount rate for taxpayers.\(^46\) Similar to the sensitivity analysis of the alternative education variable, we vary the base case discount rates for students and taxpayers on either side by increasing the discount rate by 10%, 25%, and 50%, and then reducing it by 10%, 25%, and 50%. Note that, because the student rate of return and payback period are both based on the undiscounted cash flows, they are unaffected by changes in the discount rate. As such, only variations in the net present value, internal rate of return, and benefit-cost ratio are measured.

\(^{46}\) These values are based on the baseline forecasts for the 10-year Treasury rate published by the Congressional Budget Office and the real treasury interest rates recommended by the Office of Management and Budget for 30-year investments. See the Congressional Budget Office “Table 4. Projection of Borrower Interest Rates: CBO’s March 2020 Baseline” and the Office of Management and Budget “Discount Rates for Cost-Effectiveness, Lease Purchase, and Related Analyses.”
present value and the benefit-cost ratio for students and the present value for taxpayers are shown in Table A2.4.
As demonstrated in the table, an increase in the discount rate leads to a corresponding decrease in the expected returns, and vice versa. For example, increasing the student discount rate by 50% (from 4.5% to 6.8%) reduces the students’ benefit-cost ratio from 5.0 to 4.0. Conversely, reducing the discount rate for students by 50% (from 4.5% to 2.3%) increases the benefit-cost ratio from 5.0 to 7.6. The sensitivity analysis results for taxpayers show the same inverse relationship between the discount rate and the benefits (from $1.1 million at a -50% variation from the base case to $1 million at a 50% variation from the base case).

</tbody>
</table>
Alternative education: A “with” and “without” measure of the percent of students who would still be able to avail themselves of education if the program under analysis did not exist. An estimate of 10%, for example, means that 10% of students do not depend directly on the existence of the program in order to obtain their education.

Asset value: Capitalized value of a stream of future returns. Asset value measures what someone would have to pay today for an instrument that provides the same stream of future revenues.

Attrition rate: Rate at which students leave the workforce due to out-migration, unemployment, retirement, or death.

Benefit-cost ratio: Present value of benefits divided by present value of costs. If the benefit-cost ratio is greater than 1, then benefits exceed costs, and the investment is feasible.

Counterfactual scenario: What would have happened if a given event had not occurred. In the case of this economic impact study, the counterfactual scenario is a scenario where the program did not exist.

Credit hour equivalent: Credit hour equivalent, or CHE, is defined as 15 contact hours of education if on a semester system, and 10 contact hours if on a quarter system. In general, it requires 450 contact hours to complete one full-time equivalent, or FTE.

Demand: Relationship between the market price of education and the volume of education demanded (expressed in terms of enrollment). The law of the downward-sloping demand curve is related to the fact that enrollment increases only if the price (tuition and fees) is lowered, or conversely, enrollment decreases if price increases.

Discounting: Expressing future revenues and costs in present value terms.

Earnings (labor income): Income that is received as a result of labor; i.e., wages.

Economics: Study of the allocation of scarce resources among alternative and competing ends. Economics is not normative (what ought to be done), but positive (describes what is, or how people are likely to behave in response to economic changes).
Externalities: Impacts (positive and negative) for which there is no compensation. Positive externalities of education include improved social behaviors such as improved health, lower crime, and reduced demand for income assistance. Educational institutions do not receive compensation for these benefits, but benefits still occur because education is statistically proven to lead to improved social behaviors.

Gross regional product: Measure of the final value of all goods and services produced in a region after netting out the cost of goods used in production. Alternatively, gross regional product (GRP) equals the combined incomes of all factors of production; i.e., labor, land and capital. These include wages, salaries, proprietors’ incomes, profits, rents, and other. Gross regional product is also sometimes called value added or added income.

Initial effect: Income generated by the initial injection of monies into the economy through the higher earnings of its students.

Input-output analysis: Relationship between a given set of demands for final goods and services and the implied amounts of manufactured inputs, raw materials, and labor that this requires. When educational institutions pay wages and salaries and spend money for supplies in the region, they also generate earnings in all sectors of the economy, thereby increasing the demand for goods and services and jobs. Moreover, as students enter or rejoin the workforce with higher skills, they earn higher salaries and wages. In turn, this generates more consumption and spending in other sectors of the economy.

Internal rate of return: Rate of interest that, when used to discount cash flows associated with investing in education, reduces its net present value to zero (i.e., where the present value of revenues accruing from the investment are just equal to the present value of costs incurred). This, in effect, is the break-even rate of return on investment since it shows the highest rate of interest at which the investment makes neither a profit nor a loss.

Multiplier effect: Additional income created in the economy as the program’s students spend money in the region. It consists of the income created by the supply chain of the industries initially affected by the spending of its students (i.e., the direct effect), income created by the supply chain of the initial supply chain (i.e., the indirect effect), and the income created by the increased spending of the household sector (i.e., the induced effect).

NAICS: The North American Industry Classification System (NAICS) classifies North American business establishment in order to better collect, analyze, and publish statistical data related to the business economy.

Net cash flow: Benefits minus costs, i.e., the sum of revenues accruing from an investment minus costs incurred.
Net present value: Net cash flow discounted to the present. All future cash flows are collapsed into one number, which, if positive, indicates feasibility. The result is expressed as a monetary measure.

Non-labor income: Income received from investments, such as rent, interest, and dividends.

Opportunity cost: Benefits foregone from alternative B once a decision is made to allocate resources to alternative A. Or, if individuals choose to attend the program, they forego earnings that they would have received had they chose instead to work full-time. Foregone earnings, therefore, are the “price tag” of choosing to enroll in the program at the college.

Payback period: Length of time required to recover an investment. The shorter the period, the more attractive the investment. The formula for computing payback period is:

\[
\text{Payback period} = \frac{\text{cost of investment}}{\text{net return per period}}
\]
Emsi Burning Glass’s economic impact study differs from many other studies because we prefer to report the impacts in terms of income rather than sales (or output). Income is synonymous with value added or gross regional product (GRP). Sales include all the intermediary costs associated with producing goods and services. Income is a net measure that excludes these intermediary costs:

\[ \text{Income} = \text{Sales} - \text{Intermediary Costs} \]

For this reason, income is a more meaningful measure of new economic activity than reporting sales. This is evidenced by the use of gross domestic product (GDP)—a measure of income—by economists when considering the economic growth or size of a country. The difference is GRP reflects a region and GDP a country.

To demonstrate the difference between income and sales, let us consider an example of a baker’s production of a loaf of bread. The baker buys the ingredients such as eggs, flour, and yeast for $2.00. He uses capital such as a mixer to combine the ingredients and an oven to bake the bread and convert it into a final product. Overhead costs for these steps are $1.00. Total intermediary costs are $3.00. The baker then sells the loaf of bread for $5.00.

The sales amount of the loaf of bread is $5.00. The income from the loaf of bread is equal to the sales amount less the intermediary costs:

\[ \text{Income} = \$5.00 - \$3.00 = \$2.00 \]

In our analysis, we provide context behind the income figures by also reporting the associated number of jobs. The impacts are also reported in sales and earnings terms for reference.
Emsi Burning Glass’s MR-SAM represents the flow of all economic transactions in a given region. It replaces Emsi Burning Glass’s previous input-output (IO) model, which operated with some 1,000 industries, four layers of government, a single household consumption sector, and an investment sector. The old IO model was used to simulate the ripple effects (i.e., multipliers) in the regional economy as a result of industries entering or exiting the region. The MR-SAM model performs the same tasks as the old IO model, but it also does much more. Along with the same 1,000 industries, government, household and investment sectors embedded in the old IO tool, the MR-SAM exhibits much more functionality, a greater amount of data, and a higher level of detail on the demographic and occupational components of jobs (16 demographic cohorts and about 750 occupations are characterized).

This appendix presents a high-level overview of the MR-SAM. Additional documentation on the technical aspects of the model is available upon request.

Data sources for the model

The Emsi Burning Glass MR-SAM model relies on a number of internal and external data sources, mostly compiled by the federal government. What follows is a listing and short explanation of our sources. The use of these data will be covered in more detail later in this appendix.

**Emsi Burning Glass Data** are produced from many data sources to produce detailed industry, occupation, and demographic jobs and earnings data at the local level. This information (especially sales-to-jobs ratios derived from jobs and earnings-to-sales ratios) is used to help regionalize the national matrices as well as to disaggregate them into more detailed industries than are normally available.

**BEA Make and Use Tables (MUT)** are the basis for input-output models in the U.S. The make table is a matrix that describes the amount of each commodity made by each industry in a given year. Industries are placed in the rows and commodities in the columns. The use table is a matrix that describes the amount of each commodity used by each industry in a given year. In the use table, commodities are placed in the rows and industries in the columns. The BEA produces two different sets of MUTs, the benchmark and the summary. The benchmark set contains about 500 sectors and is released every five years, with a five-year lag time (e.g., 2002 benchmark MUTs were released in 2007). The summary set contains about 80 sectors and is released every year, with a two-year lag (e.g., 2010 summary MUTs were released in late 2011/early 2012). The MUTs are used...
in the Emsi Burning Glass MR-SAM model to produce an industry-by-industry matrix describing all industry purchases from all industries.

**BEA Gross Domestic Product by State (GSP)** describes gross domestic product from the value added (also known as added income) perspective. Value added is equal to employee compensation, gross operating surplus, and taxes on production and imports, less subsidies. Each of these components is reported for each state and an aggregate group of industries. This dataset is updated once per year, with a one-year lag. The Emsi Burning Glass MR-SAM model makes use of this data as a control and pegs certain pieces of the model to values from this dataset.

**BEA National Income and Product Accounts (NIPA)** cover a wide variety of economic measures for the nation, including gross domestic product (GDP), sources of output, and distribution of income. This dataset is updated periodically throughout the year and can be between a month and several years old depending on the specific account. NIPA data are used in many of the Emsi Burning Glass MR-SAM processes as both controls and seeds.

**BEA Local Area Income (LPI)** encapsulates multiple tables with geographies down to the county level. The following two tables are specifically used: CA05 (Personal income and earnings by industry) and CA91 (Gross flow of earnings). CA91 is used when creating the commuting submodel and CA05 is used in several processes to help with place-of-work and place-of-residence differences, as well as to calculate personal income, transfers, dividends, interest, and rent.

**Bureau of Labor Statistics Consumer Expenditure Survey (CEX)** reports on the buying habits of consumers along with some information as to their income, consumer unit, and demographics. Emsi Burning Glass utilizes this data heavily in the creation of the national demographic by income type consumption on industries.

**Census of Government’s (CoG)** state and local government finance dataset is used specifically to aid breaking out state and local data that is reported in the MUTs. This allows Emsi Burning Glass to have unique production functions for each of its state and local government sectors.

**Census’ OnTheMap (OTM)** is a collection of three datasets for the census block level for multiple years. **Origin-Destination (OD)** offers job totals associated with both home census blocks and a work census block. **Residence Area Characteristics (RAC)** offers jobs totaled by home census block. **Workplace Area Characteristics (WAC)** offers jobs totaled by work census block. All three of these are used in the commuting submodel to gain better estimates of earnings by industry that may be counted as commuting. This dataset has holes for specific years and regions. These holes are filled with Census’ Journey-to-Work described later.

**Census’ Current Population Survey (CPS)** is used as the basis for the demographic breakout data of the MR-SAM model. This set is used to estimate the
ratios of demographic cohorts and their income for the three different income categories (i.e., wages, property income, and transfers).

Census’ Journey-to-Work (JtW) is part of the 2000 Census and describes the amount of commuting jobs between counties. This set is used to fill in the areas where OTM does not have data.

Census’ American Community Survey (ACS) Public Use Microdata Sample (PUMS) is the replacement for Census’ long form and is used by Emsi Burning Glass to fill the holes in the CPS data.

Oak Ridge National Lab (ORNL) County-to-County Distance Matrix (Skim Tree) contains a matrix of distances and network impedances between each county via various modes of transportation such as highway, railroad, water, and combined highway-rail. Also included in this set are minimum impedances utilizing the best combination of paths. The ORNL distance matrix is used in Emsi Burning Glass’ gravitational flows model that estimates the amount of trade between counties in the country.

Overview of the MR-SAM model

Emsi Burning Glass’s MR-SAM modeling system is a comparative static model in the same general class as RIMS II (Bureau of Economic Analysis) and IMPLAN (Minnesota Implan Group). The MR-SAM model is thus not an econometric model, the primary example of which is PolicyInsight by REMI. It relies on a matrix representation of industry-to-industry purchasing patterns originally based on national data which are regionalized with the use of local data and mathematical manipulation (i.e., non-survey methods). Models of this type estimate the ripple effects of changes in jobs, earnings, or sales in one or more industries upon other industries in a region.

The Emsi Burning Glass MR-SAM model shows final equilibrium impacts—that is, the user enters a change that perturbs the economy and the model shows the changes required to establish a new equilibrium. As such, it is not a dynamic model that shows year-by-year changes over time (as REMI’s does).

NATIONAL SAM

Following standard practice, the SAM model appears as a square matrix, with each row sum exactly equaling the corresponding column sum. Reflecting its kinship with the standard Leontief input-output framework, individual SAM elements show flows between row and column sectors during a chosen base year. Read across rows, SAM entries show the flow of funds into column accounts (also known as receipts or the appropriation of funds by those column accounts). Read down columns, SAM entries show the flow of funds into row accounts (also known as expenditures or the dispersal of funds to those row accounts).
The SAM may be broken into three different aggregation layers: broad accounts, sub-accounts, and detailed accounts. The broad layer is the most aggregate and will be covered first. Broad accounts cover between one and four sub-accounts, which in turn cover many detailed accounts. This appendix will not discuss detailed accounts directly because of their number. For example, in the industry broad account, there are two sub-accounts and over 1,000 detailed accounts.

**MULTI-REGIONAL ASPECT OF THE MR-SAM**

Multi-regional (MR) describes a non-survey model that has the ability to analyze the transactions and ripple effects (i.e., multipliers) of not just a single region, but multiple regions interacting with each other. Regions in this case are made up of a collection of counties.

Emsi Burning Glass’s multi-regional model is built off of gravitational flows, assuming that the larger a county’s economy, the more influence it will have on the surrounding counties’ purchases and sales. The equation behind this model is essentially the same that Isaac Newton used to calculate the gravitational pull between planets and stars. In Newton’s equation, the masses of both objects are multiplied, then divided by the distance separating them and multiplied by a constant. In Emsi Burning Glass’s model, the masses are replaced with the supply of a sector for one county and the demand for that same sector from another county. The distance is replaced with an impedance value that takes into account the distance, type of roads, rail lines, and other modes of transportation. Once this is calculated for every county-to-county pair, a set of mathematical operations is performed to make sure all counties absorb the correct amount of supply from every county and the correct amount of demand from every county. These operations produce more than 200 million data points.

**Components of the Emsi Burning Glass MR-SAM model**

The Emsi Burning Glass MR-SAM is built from a number of different components that are gathered together to display information whenever a user selects a region. What follows is a description of each of these components and how each is created. Emsi Burning Glass’s internally created data are used to a great extent throughout the processes described below, but its creation is not described in this appendix.

**COUNTY EARNINGS DISTRIBUTION MATRIX**

The county earnings distribution matrices describe the earnings spent by every industry on every occupation for a year—i.e., earnings by occupation. The matrices are built utilizing Emsi Burning Glass’s industry earnings, occupational average earnings, and staffing patterns.

Each matrix starts with a region’s staffing pattern matrix which is multiplied by the industry jobs vector. This produces the number of occupational jobs in
each industry for the region. Next, the occupational average hourly earnings per job are multiplied by 2,080 hours, which converts the average hourly earnings into a yearly estimate. Then the matrix of occupational jobs is multiplied by the occupational annual earnings per job, converting it into earnings values. Last, all earnings are adjusted to match the known industry totals. This is a fairly simple process, but one that is very important. These matrices describe the place-of-work earnings used by the MR-SAM.

COMMUTING MODEL

The commuting sub-model is an integral part of Emsi Burning Glass’s MR-SAM model. It allows the regional and multi-regional models to know what amount of the earnings can be attributed to place-of-residence vs. place-of-work. The commuting data describe the flow of earnings from any county to any other county (including within the counties themselves). For this situation, the commuted earnings are not just a single value describing total earnings flows over a complete year, but are broken out by occupation and demographic. Breaking out the earnings allows for analysis of place-of-residence and place-of-work earnings. These data are created using Bureau of Labor Statistics’ OnTheMap dataset, Census’ Journey-to-Work, BEA’s LPI CA91 and CA05 tables, and some of Emsi Burning Glass’s data. The process incorporates the cleanup and disaggregation of the OnTheMap data, the estimation of a closed system of county inflows and outflows of earnings, and the creation of finalized commuting data.

NATIONAL SAM

The national SAM as described above is made up of several different components. Many of the elements discussed are filled in with values from the national Z matrix—or industry-to-industry transaction matrix. This matrix is built from BEA data that describe which industries make and use what commodities at the national level. These data are manipulated with some industry standard equations to produce the national Z matrix. The data in the Z matrix act as the basis for the majority of the data in the national SAM. The rest of the values are filled in with data from the county earnings distribution matrices, the commuting data, and the BEA’s National Income and Product Accounts.

One of the major issues that affect any SAM project is the combination of data from multiple sources that may not be consistent with one another. Matrix balancing is the broad name for the techniques used to correct this problem. Emsi Burning Glass uses a modification of the “diagonal similarity scaling” algorithm to balance the national SAM.

GRAVITATIONAL FLOWS MODEL

The most important piece of the Emsi Burning Glass MR-SAM model is the gravitational flows model that produces county-by-county regional purchasing coefficients (RPCs). RPCs estimate how much an industry purchases from other
industries inside and outside of the defined region. This information is critical for calculating all IO models.

Gravity modeling starts with the creation of an impedance matrix that values the difficulty of moving a product from county to county. For each sector, an impedance matrix is created based on a set of distance impedance methods for that sector. A distance impedance method is one of the measurements reported in the Oak Ridge National Laboratory’s County-to-County Distance Matrix. In this matrix, every county-to-county relationship is accounted for in six measures: great-circle distance, highway impedance, rail miles, rail impedance, water impedance, and highway-rail-highway impedance. Next, using the impedance information, the trade flows for each industry in every county are solved for. The result is an estimate of multi-regional flows from every county to every county. These flows are divided by each respective county’s demand to produce multi-regional RPCs.
Two key components in the analysis are 1) the value of the students’ educational achievements, and 2) the change in that value over the students’ working careers. Both of these components are described in detail in this appendix.

**Value per CHE**

Typically, the educational achievements of students are marked by the credentials they earn. However, not all students who enrolled in the Avionics Technology program at GTCC in FY 2019-20 obtained a degree or certificate. Some returned the following year to complete their education goals, while others took a few courses and entered the workforce without graduating. As such, the only way to measure the value of the students’ achievement is through their credit hour equivalents, or CHEs. This approach allows us to see the benefits to all students who enrolled in the program at the college, not just those who earned a credential.

To calculate the value per CHE, we first determine how many CHEs are required to complete each education level. For example, assuming that there are 30 CHEs in an academic year, a student generally completes 120 CHEs in order to move from a high school diploma to a bachelor’s degree, another 60 CHEs to move from a bachelor’s degree to a master’s degree, and so on. This progression of CHEs generates an education ladder beginning at the less than high school level and ending with the completion of a doctoral degree, with each level of education representing a separate stage in the progression.

The second step is to assign a unique value to the CHEs in the education ladder based on the wage differentials. For example, the difference in county earnings between a high school diploma and an associate degree is $13,500. We spread this $13,500 wage differential across the 60 CHEs that occur between a high school diploma and an associate degree, applying a ceremonial “boost” to the last CHE in the stage to mark the achievement of the degree. We repeat this process for each education level in the ladder.

---

47 The value per CHE is different between the economic impact analysis and the investment analysis. The economic impact analysis uses the county as its background and, therefore, uses county earnings to calculate value per CHE, while the investment analysis uses the state as its backdrop and, therefore, uses state earnings. The methodology outlined in this appendix will use county earnings; however, the same methodology is followed for the investment analysis when state earnings are used.

48 Economic theory holds that workers that acquire education credentials send a signal to employers about their ability level. This phenomenon is commonly known as the sheepskin effect or signaling effect. The ceremonial boosts applied to the achievement of degrees in the Emsi Burning Glass impact model are derived from Jaeger and Page (1996).
Next, we map the CHE production of the FY 2019-20 student population to the education ladder. In total, students completed 876 CHEs during the analysis year. We map each of these CHEs to the education ladder depending on the students’ education level and the average number of CHEs they completed during the year. For example, bachelor’s degree graduates are allocated to the stage between the associate degree and the bachelor’s degree, and the average number of CHEs they completed informs the shape of the distribution curve used to spread out their total CHE production within that stage of the progression.

The sum product of the CHEs earned at each step within the education ladder and their corresponding value yields the students’ aggregate annual increase in income ($\Delta E$), as shown in the following equation:

$$\Delta E = \sum_{i=1}^{n} e_i h_i \quad \text{where} \quad i \in 1, 2, \ldots, n$$

and $n$ is the number of steps in the education ladder, $e_i$ is the marginal earnings gain at step $i$, and $h_i$ is the number of CHEs completed at step $i$.

Table A6.1 displays the result for the students’ aggregate annual increase in income ($\Delta E$), a total of $177,400 thousand. By dividing this value by the students’ total production of 876 CHEs during the analysis year, we derive an overall value of $203 per CHE.

**Mincer function**

The $203 value per CHE in Table A6.1 only tells part of the story, however. Human capital theory holds that earnings levels do not remain constant; rather, they start relatively low and gradually increase as the worker gains more experience. Research also shows that the earnings increment between educated and non-educated workers grows through time. These basic patterns in earnings over time were originally identified by Jacob Mincer, who viewed the lifecycle earnings distribution as a function with the key elements being earnings, years of education, and work experience, with age serving as a proxy for experience.\(^49\) While some have criticized Mincer’s earnings function, it is still upheld in recent data and has served as the foundation for a variety of research pertaining to labor economics. Those critical of the Mincer function point to several unobserved
factors such as ability, socioeconomic status, and family background that also help explain higher earnings. Failure to account for these factors results in what is known as an “ability bias.” Research by Card (1999 and 2001) suggests that the benefits estimated using Mincer's function are biased upwards by 10% or less. As such, we reduce the estimated benefits by 10%. We use state-specific and education level-specific Mincer coefficients.

Figure A6.1 illustrates several important points about the Mincer function. First, as demonstrated by the shape of the curves, an individual’s earnings initially increase at an increasing rate, then increase at a decreasing rate, reach a maximum somewhere well after the midpoint of the working career, and then decline in later years. Second, individuals with higher levels of education reach their maximum earnings at an older age compared to individuals with lower levels of education (recall that age serves as a proxy for years of experience). And third, the benefits of education, as measured by the difference in earnings between education levels, increase with age.

In calculating the alumni impact in Chapter 3, we use the slope of the curve in Mincer's earnings function to condition the $203 value per CHE to the students' age and work experience. To the students just starting their career during the analysis year, we apply a lower value per CHE; to the students in the latter half or approaching the end of their careers we apply a higher value per CHE. The original $203 value per CHE applies only to the CHE production of students precisely at the midpoint of their careers during the analysis year.

We again apply the Mincer function, this time to project the benefits stream of the FY 2019-20 student population into the future. Here too the value per CHE is lower for students at the start of their career and higher near the end of it, in accordance with the scalars derived from the slope of the Mincer curve illustrated in Figure A6.1.
In a scenario where the program did not exist, some of its students would still be able to avail themselves of an alternative comparable education. These students create benefits in the region even in the absence of the program. The alternative education variable accounts for these students and is used to discount the benefits we attribute to the program.

Recall this analysis considers only relevant economic information regarding the program. Considering the existence of various other academic institutions surrounding the college, we have to assume that a portion of the students could find alternative education and either remain in or return to the region. For example, some students may participate in online programs while remaining in the region. Others may attend an out-of-region institution and return to the region upon completing their studies. For these students—who would have found an alternative education and produced benefits in the region regardless of the presence of the program—we discount the benefits attributed to the program. An important distinction must be made here: the benefits from students who would find alternative education outside the region and not return to the region are not discounted. Because these benefits would not occur in the region without the presence of the program, they must be included.

In the absence of the program, we assume 15% of the program’s students would find alternative education opportunities and remain in or return to the region. We account for this by discounting the alumni impact, the benefits to taxpayers by 15%. In other words, we assume 15% of the benefits created by the program’s students would have occurred anyway in the counterfactual scenario where the program did not exist. A sensitivity analysis of this adjustment is presented in Appendix 1.
APPENDIX 8: OVERVIEW OF INVESTMENT ANALYSIS MEASURES

The appendix provides context to the investment analysis results using the simple hypothetical example summarized in Table A8.1 below. The table shows the projected benefits and costs for a single student over time and associated investment analysis results.\(^{50}\)

</tbody>
</table>

Assumptions are as follows:

- Benefits and costs are projected out 10 years into the future (Column 1).
- The student attends the college for one year, and the cost of tuition is $1,500 (Column 2).
- Earnings foregone while attending the college for one year (opportunity cost) come to $20,000 (Column 3).
- Together, tuition and earnings foregone cost sum to $21,500. This represents the out-of-pocket investment made by the student (Column 4).

\(^{50}\) Note that this is a hypothetical example. The numbers used are not based on data collected from an existing college.
• In return, the student earns $5,000 more per year than he otherwise would have earned without the education (Column 5).

• The net cash flow (NCF) in Column 6 shows higher earnings (Column 5) less the total cost (Column 4).

• The assumed going rate of interest is 4%, the rate of return from alternative investment schemes for the use of the $21,500.

Results are expressed in standard investment analysis terms, which are as follows: the net present value, the internal rate of return, the benefit-cost ratio, and the payback period. Each of these is briefly explained below in the context of the cash flow numbers presented in Table A8.1.

Net present value

The student in Table A8.1 can choose either to attend college or to forego post-secondary education and maintain his present employment. If he decides to enroll, certain economic implications unfold. Tuition and fees must be paid, and earnings will cease for one year. In exchange, the student calculates that with post-secondary education, his earnings will increase by at least the $5,000 per year, as indicated in the table.

The question is simple: Will the prospective student be economically better off by choosing to enroll? If he adds up higher earnings of $5,000 per year for the remaining nine years in Table A8.1, the total will be $45,000. Compared to a total investment of $21,500, this appears to be a very solid investment. The reality, however, is different. Benefits are far lower than $45,000 because future money is worth less than present money. Costs (tuition plus earnings foregone) are felt immediately because they are incurred today, in the present. Benefits, on the other hand, occur in the future. They are not yet available. All future benefits must be discounted by the going rate of interest (referred to as the discount rate) to be able to express them in present value terms.\(^1\)

Let us take a brief example. At 4%, the present value of $5,000 to be received one year from today is $4,807. If the $5,000 were to be received in year 10, the present value would reduce to $3,377. Put another way, $4,807 deposited in the bank today earning 4% interest will grow to $5,000 in one year; and $3,377 deposited today would grow to $5,000 in 10 years. An “economically rational” person would, therefore, be equally satisfied receiving $3,377 today or $5,000 10 years from today given the going rate of interest of 4%. The process of discounting—finding the present value of future higher earnings—allows the model to express values on an equal basis in future or present value terms.

---

\(^1\) Technically, the interest rate is applied to compounding—the process of looking at deposits today and determining how much they will be worth in the future. The same interest rate is called a discount rate when the process is reversed—determining the present value of future earnings.
The goal is to express all future higher earnings in present value terms so that they can be compared to investments incurred today (in this example, tuition plus earnings foregone). As indicated in Table A8.1 the cumulative present value of $5,000 worth of higher earnings between years 2 and 10 is $35,753 given the 4% interest rate, far lower than the undiscounted $45,000 discussed above.

The net present value of the investment is $14,253. This is simply the present value of the benefits less the present value of the costs, or $35,753 – $21,500 = $14,253. In other words, the present value of benefits exceeds the present value of costs by as much as $14,253. The criterion for an economically worthwhile investment is that the net present value is equal to or greater than zero. Given this result, it can be concluded that, in this case, and given these assumptions, this particular investment in education is very strong.

**Internal rate of return**

The internal rate of return is another way of measuring the worth of investing in education using the same cash flows shown in Table A8.1. In technical terms, the internal rate of return is a measure of the average earning power of money used over the life of the investment. It is simply the interest rate that makes the net present value equal to zero. In the discussion of the net present value above, the model applies the going rate of interest of 4% and computes a positive net present value of $14,253. The question now is what the interest rate would have to be in order to reduce the net present value to zero. Obviously it would have to be higher—18.0% in fact, as indicated in Table A8.1. Or, if a discount rate of 18.0% were applied to the net present value calculations instead of the 4%, then the net present value would reduce to zero.

What does this mean? The internal rate of return of 18.0% defines a breakeven solution—the point where the present value of benefits just equals the present value of costs, or where the net present value equals zero. Or, at 18.0%, higher earnings of $5,000 per year for the next nine years will earn back all investments of $21,500 made plus pay 18.0% for the use of that money ($21,500) in the meantime. Is this a good return? Indeed, it is. If it is compared to the 4% going rate of interest applied to the net present value calculations, 18.0% is far higher than 4%. It may be concluded, therefore, that the investment in this case is solid. Alternatively, comparing the 18.0% rate of return to the long-term 10% rate or so obtained from investments in stocks and bonds also indicates that the investment in education is strong relative to the stock market returns (on average).

**Benefit-cost ratio**

The benefit-cost ratio is simply the present value of benefits divided by present value of costs, or $35,753 ÷ $21,500 = 1.7 (based on the 4% discount rate). Of course, any change in the discount rate would also change the benefit-cost ratio. Applying the 18.0% internal rate of return discussed above would reduce the benefit-cost ratio to 1.0, the breakeven solution where benefits just equal costs.
Applying a discount rate higher than the 18.0% would reduce the ratio to lower than 1.0, and the investment would not be feasible. The 1.7 ratio means that a dollar invested today will return a cumulative $1.70 over the ten-year time period.

**Payback period**

This is the length of time from the beginning of the investment (consisting of tuition and earnings foregone) until higher future earnings give a return on the investment made. For the student in Table A8.1, it will take roughly 4.2 years of $5,000 worth of higher earnings to recapture his investment of $1,500 in tuition and the $20,000 in earnings foregone while attending the college. Higher earnings that occur beyond 4.2 years are the returns that make the investment in education in this example economically worthwhile. The payback period is a fairly rough, albeit common, means of choosing between investments. The shorter the payback period, the stronger the investment.
APPENDIX 9: SOCIAL EXTERNALITIES

Education has a predictable and positive effect on a diverse array of social benefits. These, when quantified in dollar terms, represent significant social savings that directly benefit society communities and citizens throughout the region, including taxpayers. In this appendix we discuss the following three main benefit categories: 1) improved health, 2) reductions in crime, and 3) reduced demand for government-funded income assistance.

It is important to note that the data and estimates presented here should not be viewed as exact, but rather as indicative of the positive impacts of education on an individual’s quality of life. The process of quantifying these impacts requires a number of assumptions to be made, creating a level of uncertainty that should be borne in mind when reviewing the results.

Health

Statistics show a correlation between increased education and improved health. The manifestations of this are found in five health-related variables: smoking, alcohol dependence, obesity, depression, and drug abuse. There are other health-related areas that link to educational attainment, but these are omitted from the analysis until we can invoke adequate (and mutually exclusive) databases and are able to fully develop the functional relationships between them.

SMOKING

Despite a marked decline over the last several decades in the percentage of U.S. residents who smoke, a sizeable percentage of the U.S. population still smokes. The negative health effects of smoking are well documented in the literature, which identifies smoking as one of the most serious health issues in the U.S.

Figure A9.1 shows the prevalence of cigarette smoking among adults, 25 years and over, based on data provided by the National Health Interview Survey.52 The data include adults who reported smoking more than 100 cigarettes during their lifetime and who, at the time of interview, reported smoking every day or some days. As indicated, the percent of who smoke begins to decline beyond the level of high school education.

---

The Centers for Disease Control and Prevention (CDC) reports the percentage of adults who are current smokers by state.\textsuperscript{53} We use this information to create an index value by which we adjust the national prevalence data on smoking to each state. For example, 17.4\% of North Carolina adults were smokers in 2018, relative to 15.9\% for the nation. We thus apply a scalar of 1.09 to the national probabilities of smoking in order to adjust them to the state of North Carolina.

**ALCOHOL DEPENDENCE**

Although alcohol dependence has large public and private costs, it is difficult to measure and define. There are many patterns of drinking, ranging from abstinence to heavy drinking. Alcohol abuse is riddled with social costs, including health care expenditures for treatment, prevention, and support; workplace losses due to reduced worker productivity; and other effects.

Figure A9.2 compares the percentage of adults, 18 and older, that abuse or depend on alcohol by education level, based on data from the Substance Abuse and Mental Health Services Administration (SAMHSA).\textsuperscript{54} These statistics give an indication of the correlation between education and the reduced probability of alcohol dependence. Adults with an associate degree or some college have higher rates of alcohol dependence than adults with a high school diploma or lower. Prevalence rates are lower for adults with a bachelor’s degree or higher than those with an associate degree or some college. Although the data do not maintain a pattern of decreased alcohol dependence at every level of increased education, we include these rates in our model to ensure we provide a comprehensive view of the social benefits and costs correlated with education.

**OBESITY**

The rise in obesity and diet-related chronic diseases has led to increased attention on how expenditures relating to obesity have increased in recent years. The average cost of obesity-related medical conditions is calculated using information from the *Journal of Occupational and Environmental Medicine*, which reports incremental medical expenditures and productivity losses due to excess weight.\textsuperscript{55}

Data for Figure A9.3 is derived from the National Center for Health Statistics which shows the prevalence of obesity among adults aged 20 years and over by education, gender, and ethnicity.\textsuperscript{56} As indicated, college graduates are less likely to be obese than individuals with a high school diploma. However, the

\textsuperscript{54} Substance Abuse and Mental Health Services Administration. “Table 5.4B—Alcohol Use Disorder in Past Year among Persons Aged 12 or Older, by Age Group and Demographic Characteristics: Percentages, 2017 and 2018.” SAMHSA, Center for Behavioral Health Statistics and Quality, National Survey on Drug Use and Health, 2017 and 2018.

prevalence of obesity among adults with some college is actually greater than those with just a high school diploma. In general, though, obesity tends to decline with increasing levels of education.

**DEPRESSION**

Capturing the full economic cost of mental illness is difficult because not all mental disorders have a correlation with education. For this reason, we only examine the economic costs associated with major depressive disorder (MDD), which are comprised of medical and pharmaceutical costs, workplace costs such as absenteeism, and suicide-related costs.  

Figure A9.4 summarizes the prevalence of MDD among adults by education level, based on data provided by the CDC. As shown, people with some college are most likely to have MDD compared to those with other levels of educational attainment. People with a high school diploma or less, along with college graduates, are all fairly similar in the prevalence rates.

**DRUG ABUSE**

The burden and cost of illicit drug abuse is enormous in the U.S., but little is known about the magnitude of costs and effects at a national level. What is known is that the rate of people abusing drugs is inversely proportional to their education level. The higher the education level, the less likely a person is to abuse or depend on illicit drugs. The probability that a person with less than a high school diploma will abuse drugs is 3.9%, twice as large as the probability of drug abuse for college graduates (1.7%). This relationship is presented in Figure A9.5 based on data supplied by SAMHSA. Similar to alcohol abuse, prevalence does not strictly decline at every education level. Health costs associated with illegal drug use are also available from SAMSHA, with costs to state government representing 40% of the total cost related to illegal drug use.

**Crime**

As people achieve higher education levels, they are statistically less likely to commit crimes. The analysis identifies the following three types of crime-related expenses: 1) criminal justice expenditures, including police protection, judicial
and legal, and corrections, 2) victim costs, and 3) productivity lost as a result of time spent in jail or prison rather than working.

Figure A9.6 displays the educational attainment of the incarcerated population in the U.S. Data are derived from the breakdown of the inmate population by education level in federal, state, and local prisons as provided by the U.S. Census Bureau.61

Victim costs comprise material, medical, physical, and emotional losses suffered by crime victims. Some of these costs are hidden, while others are available in various databases. Estimates of victim costs vary widely, attributable to differences in how the costs are measured. The lower end of the scale includes only tangible out-of-pocket costs, while the higher end includes intangible costs related to pain and suffering.62

Yet another measurable cost is the economic productivity of people who are incarcerated and are thus not employed. The measurable productivity cost is simply the number of additional incarcerated people, who could have been in the labor force, multiplied by the average income of their corresponding education levels.

Income assistance

Statistics show that as education levels increase, the number of applicants for government-funded income assistance such as welfare and unemployment benefits declines. Welfare and unemployment claimants can receive assistance from a variety of different sources, including Temporary Assistance for Needy Families (TANF), Supplemental Nutrition Assistance Program (SNAP), Medicaid, Supplemental Security Income (SSI), and unemployment insurance.63

Figure A9.7 relates the breakdown of TANF recipients by education level, derived from data provided by the U.S. Department of Health and Human Services.64 As shown, the demographic characteristics of TANF recipients are weighted heavily towards the less than high school and high school categories, with a much smaller representation of individuals with greater than a high school education.

Unemployment rates also decline with increasing levels of education, as illustrated in Figure A9.8. These data are provided by the Bureau of Labor Statistics.65 As shown, unemployment rates range from 5.4% for those with less than a high school diploma to 1.9% for those at the graduate degree level or higher.

63 Medicaid is not considered in this analysis because it overlaps with the medical expenses in the analyses for smoking, alcohol dependence, obesity, depression, and drug abuse. We also exclude any welfare benefits associated with disability and age.
